

Threshold photoproduction of J/ψ with the GlueX experiment

*Lubomir Pentchev
Jefferson Lab
for the GlueX collaboration*

*7th Workshop of the APS Topical Group
on Hadron Physics,
Washington, DC February 1-3 2017*

What's in the talk

- *Motivation*
- *The GlueX Detectors*
- *Electron identification*
 - *Using calorimeters*
- *Early results from engineering run ($\sim 7 \text{ pb}^{-1}$)*
 - *Di-electron invariant mass spectrum: $\gamma p \rightarrow p e^+ e^-$*
 - *J/ψ photoproduction – energy and t -dependence:*
$$\gamma p \rightarrow p J/\psi, \quad J/\psi \rightarrow e^+ e^-$$
- *Future plans – more statistics*
 - *(Improved PID with Transition Radiation Detector)*

No absolute results will be shown!

This work done in collaboration with Northwestern University group: Prof. K. Seth (leader and initiator of the project), S. Dobbs, and L. Robison (Ph.D. student)

Motivation

- *For J/ψ photoproduction - limited data exists in the low energy region: from SLAC [Camerini et al. PRL 35, 389 (1975) and Cornell [Gittelmann et al. PRL 35, 1616(1975)]*
- *Production mechanism not well understood (more than 40 years after its discovery in 1974) especially near the threshold.*
- *Kharzaev et al. [NPA 661, 568 (1999)] – connection to gluon configuration of the nucleon*
- *Brodsky et al. [PLB 498, 23 (2001)] – near threshold J/ψ photoproduction sensitive to multi-quark correlation in nucleon; made predictions using two- and three-gluon-exchange model*
- *LHCb observed exotic states (pentaquark) $P_c(4380,4450)$ in the $p J/\psi$ channel. If produced in s-channel $\gamma p \rightarrow P_c \rightarrow p J/\psi$, will show up at $E_\gamma = 10$ GeV, within the GlueX energy range.*

GlueX experiment - Introduction

12 GeV CEBAF

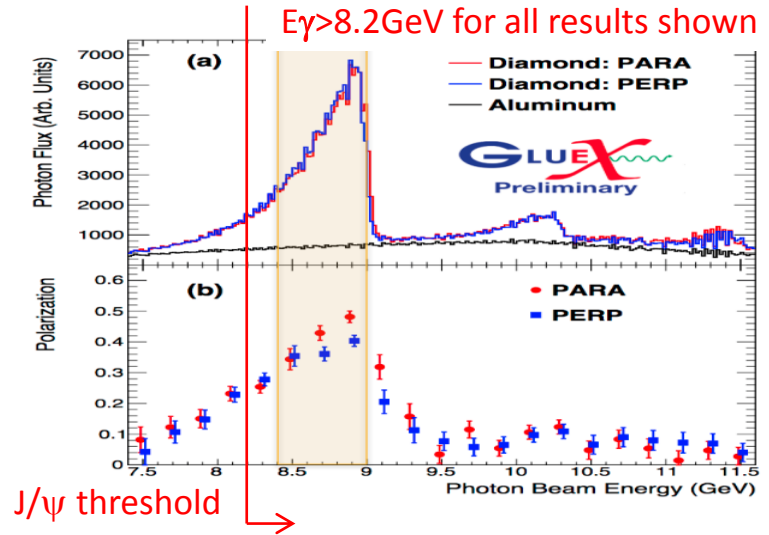

Hall D

GlueX experiment – polarized photon beam

- Electron beam incident on thin diamond radiator produces coherent bremsstrahlung
- Photon energy tagged by scattered electron $\sim 0.1\text{-}0.3\%$ resolution
- Photon beam collimated at 75m, $<25 \mu\text{rad}$
- Coherent bremsstrahlung polarization after collimation up to 40%
- Intensity: now $\sim 10^7 \gamma/\text{sec}$, later $5 \cdot 10^7 \gamma/\text{sec}$ (in the coherent peak)

The GlueX detector

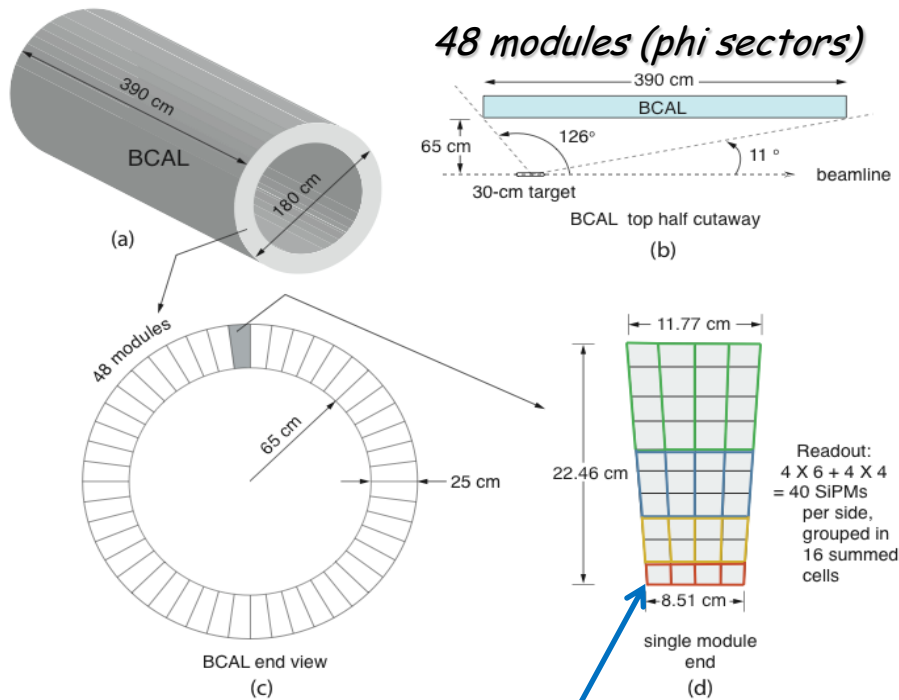

- Hermetic detector: 1 – 120° polar and full azimuthal acceptance – very uniform in t
- Tracking: $\sigma_{p/p} \sim 1 - 3\%$
- Calorimetry: $\sigma_{E/E} \sim 6\%/ \sqrt{E} + 2\%$

From tagger, collimator cave, pair spectrometer

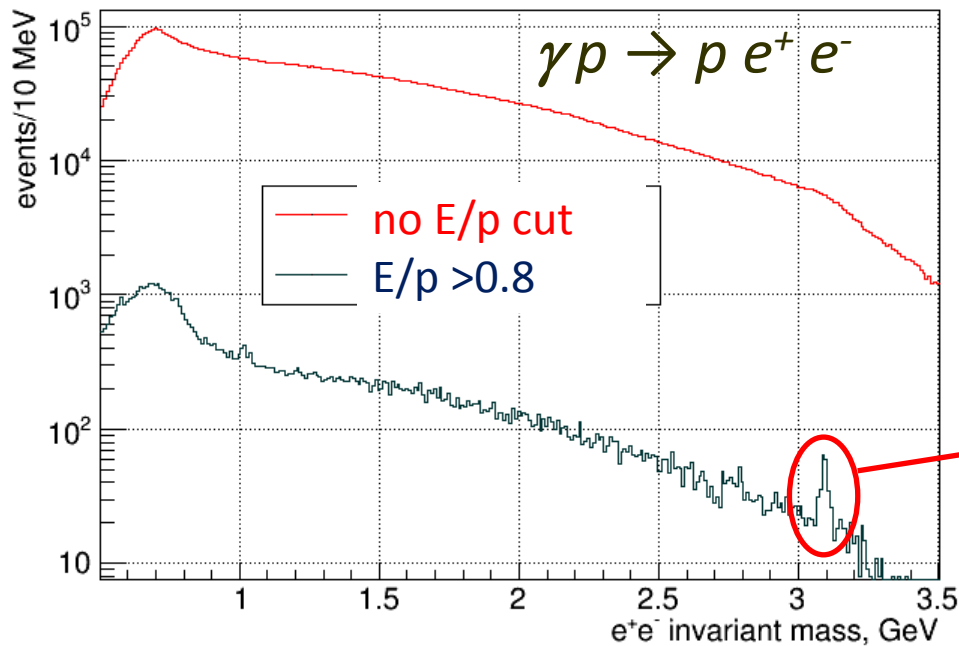

Electron identification – BCAL (barrel calorimeter)

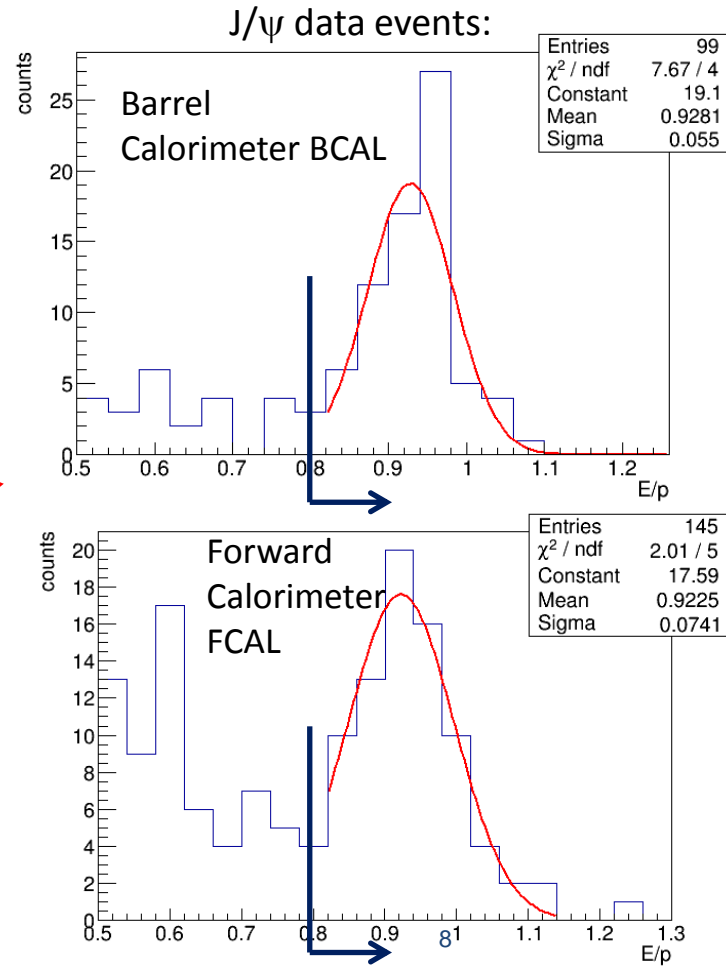

- Radial segmentation can be used for information on longitudinal shower development
- In this studies we use the **first layer** (out of 10) as **pre-shower**

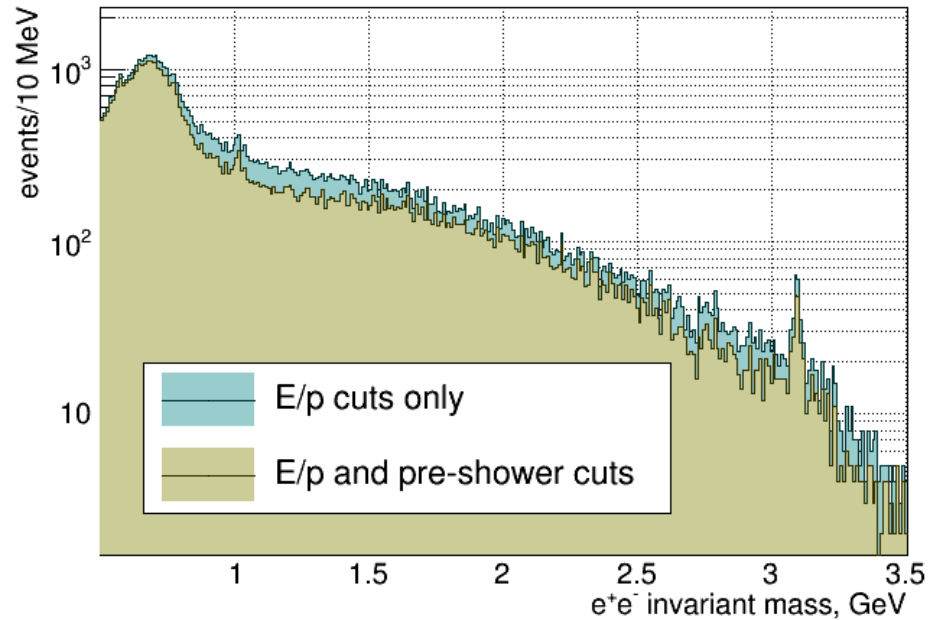

Electron identification - using E/p

Electrons identified by energy deposition in calorimeters E, relative to momentum from tracking p: E/p

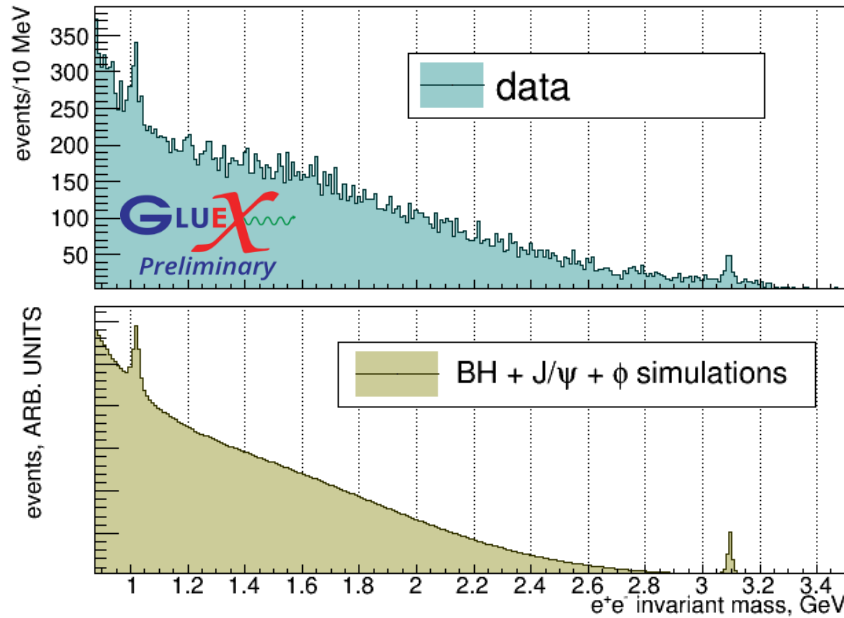

Electron identification – barrel calorimeter as pre-shower

- For high invariant masses at least one of the electrons is in the barrel calorimeter and the pre-shower helps to separate pions
- For invariant masses < 1.5 GeV, electrons in forward direction, higher pion background, requiring better electron identification – Transition Radiation Detector under study

Di-electron Spectrum – comparison to MC

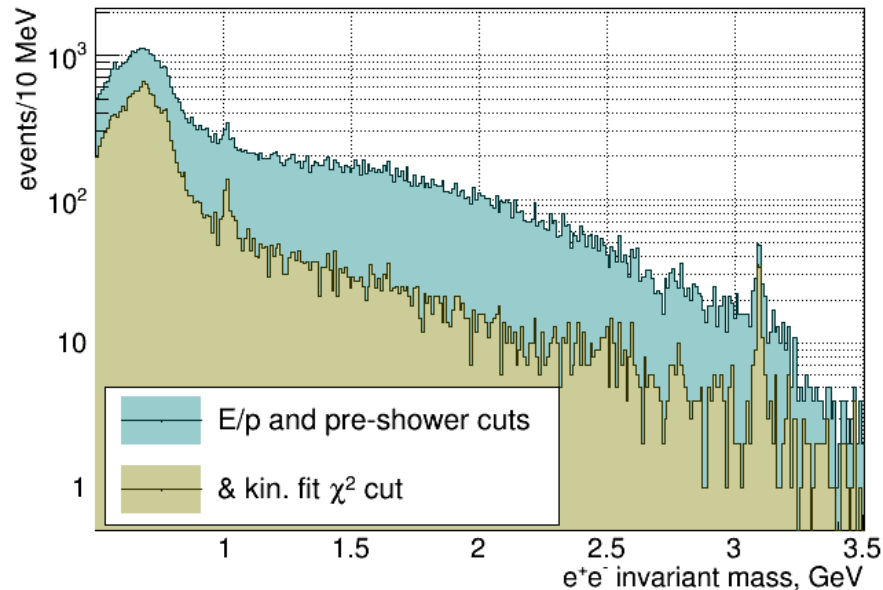

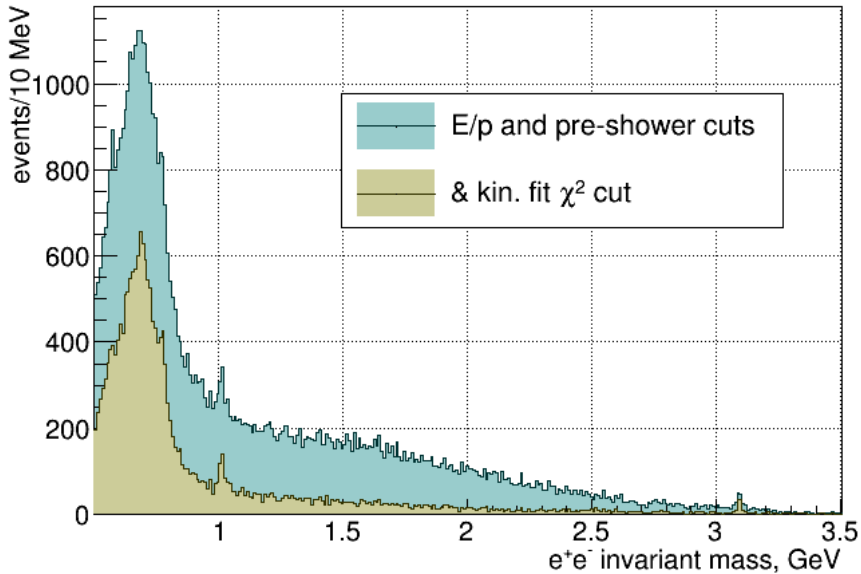

- Bethe-Heitler simulation using code GenTCS (JLab Hall B), based on:
E.Berger, M.Diehl and B.Pire “Time - like Compton scattering: Exclusive photoproduction of lepton pairs”
<http://inspirehep.net/record/563798>
- Generated also J/ ψ and ϕ events assuming t-slopes of 1 and 4 GeV⁻² respectively

Di-electron Spectrum – kinematic fit vs missing mass

- Another method for invariant mass reconstruction – missing mass of inclusive reaction $\gamma p \rightarrow p X$
- Missing mass has good enough resolution in J/ψ region
- Kinematic fit (without any cuts) needed for lower invariant masses (including ϕ)

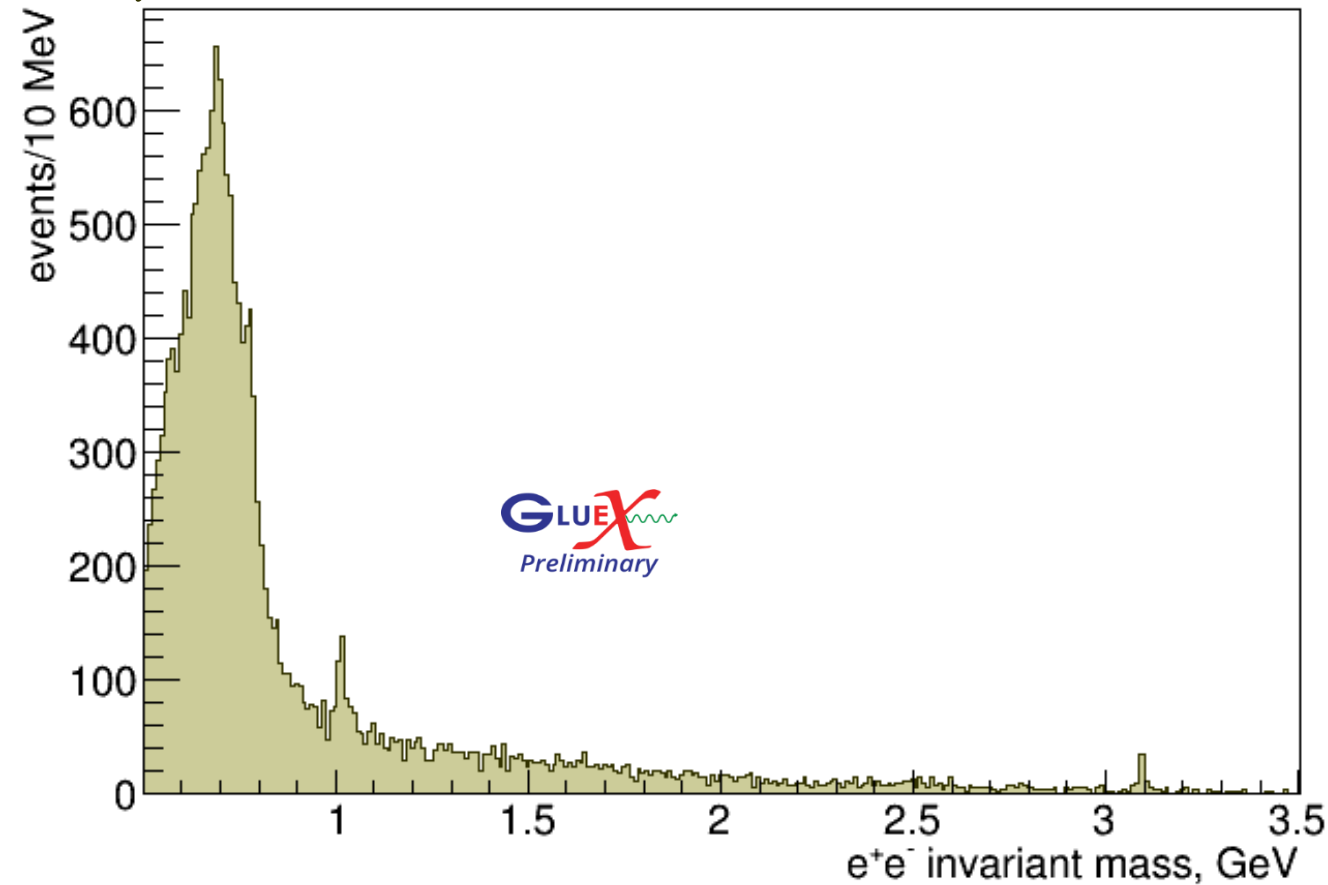

$\gamma p \rightarrow J/\psi p$ background – kinematic fit cut

- Applying cut on kinematic fit χ^2 that significantly reduces the background, while the signals in J/ψ and ϕ drop only by $\sim 25\%$

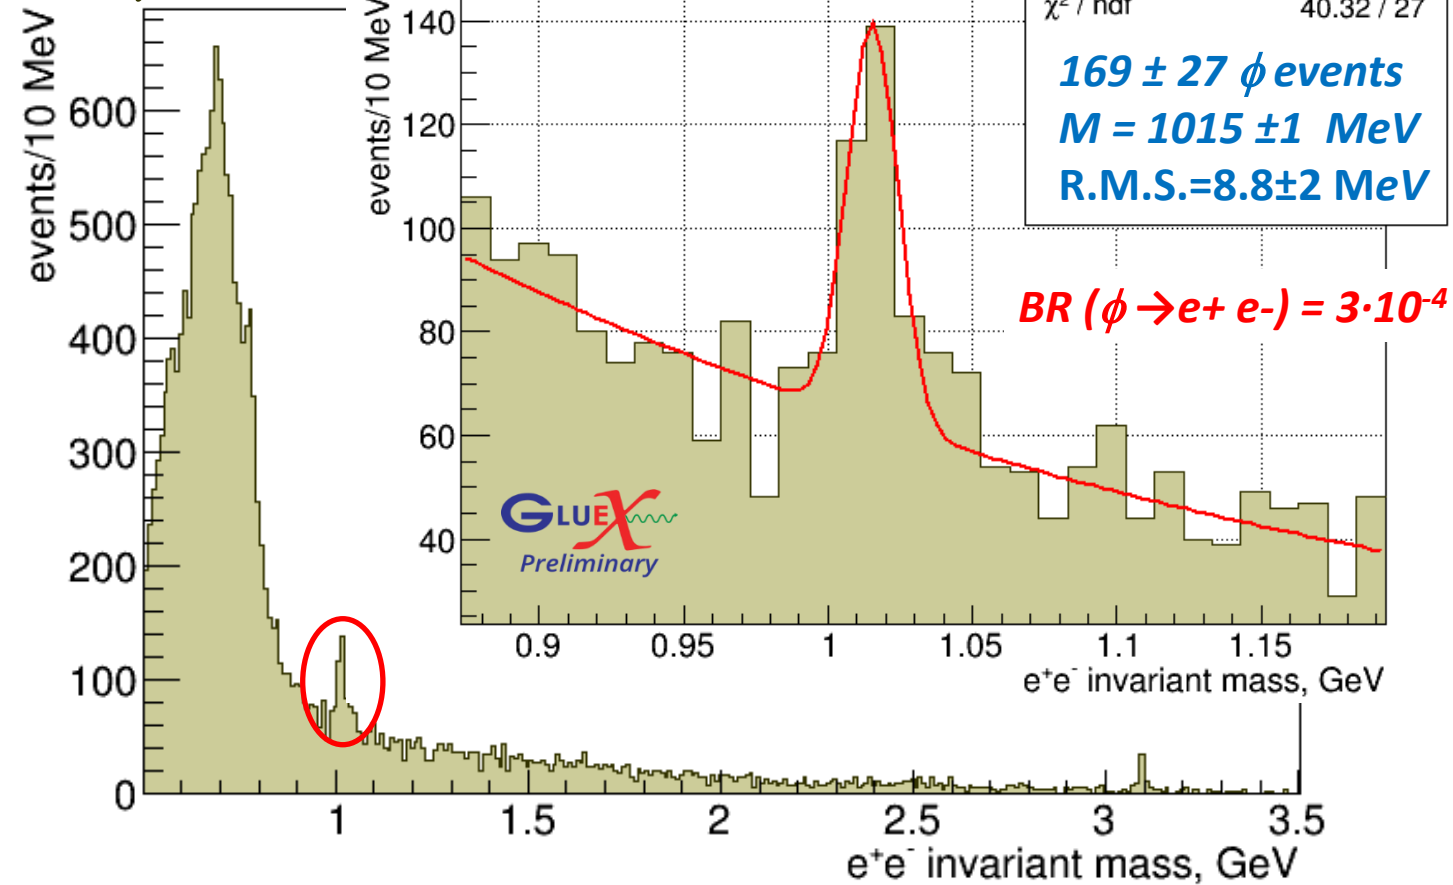

Di-electron Spectrum

$$\gamma p \rightarrow p e^+ e^-$$

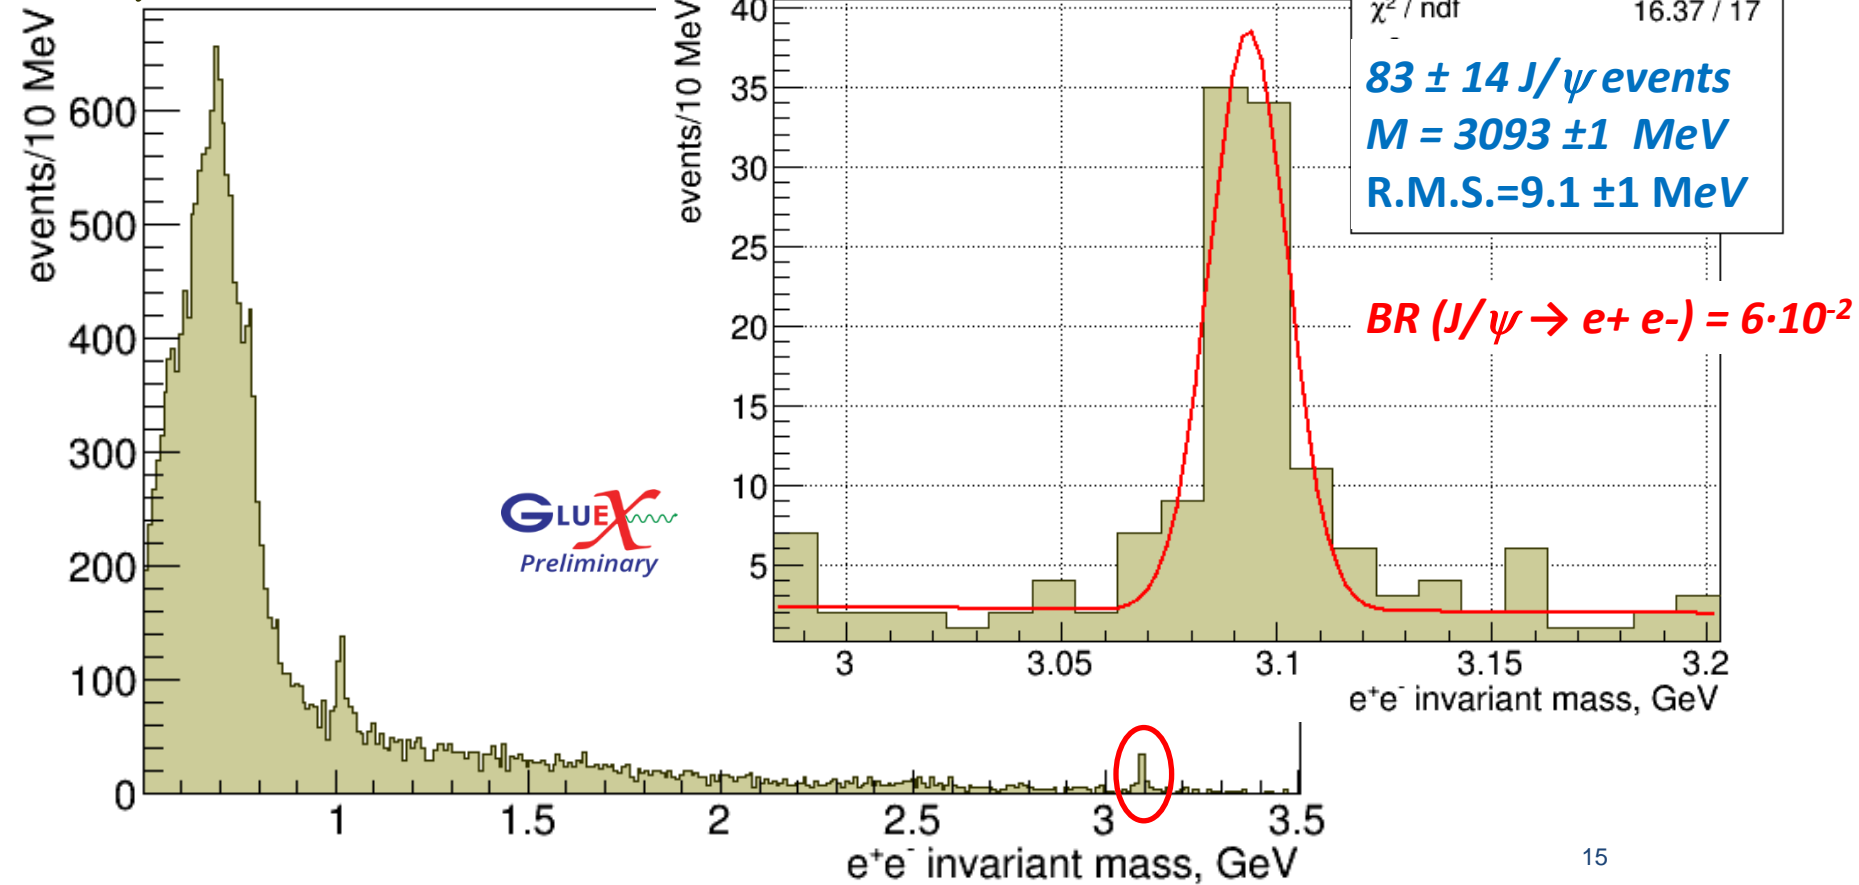

Di-electron Spectrum - ϕ

$\gamma p \rightarrow p e^+ e^-$

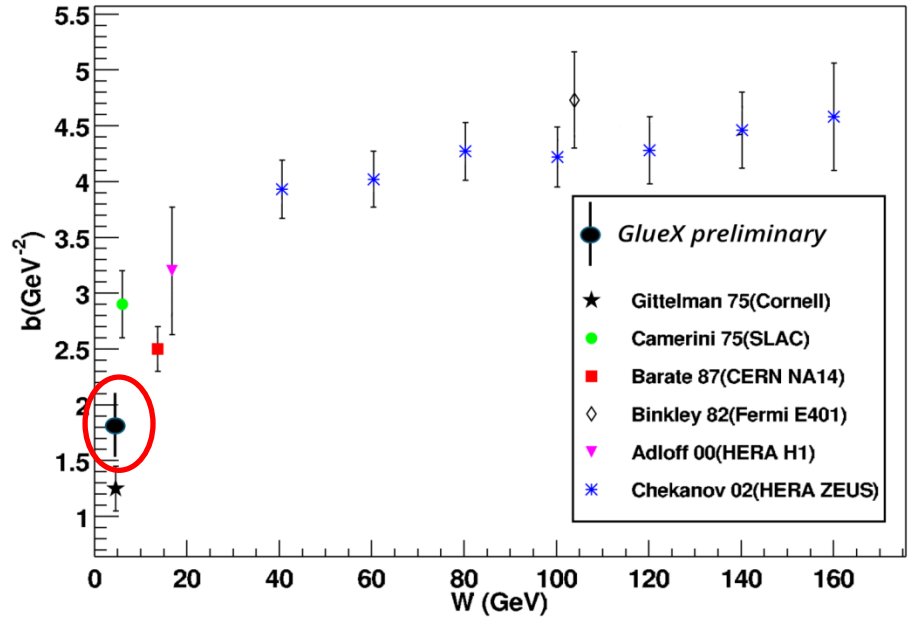

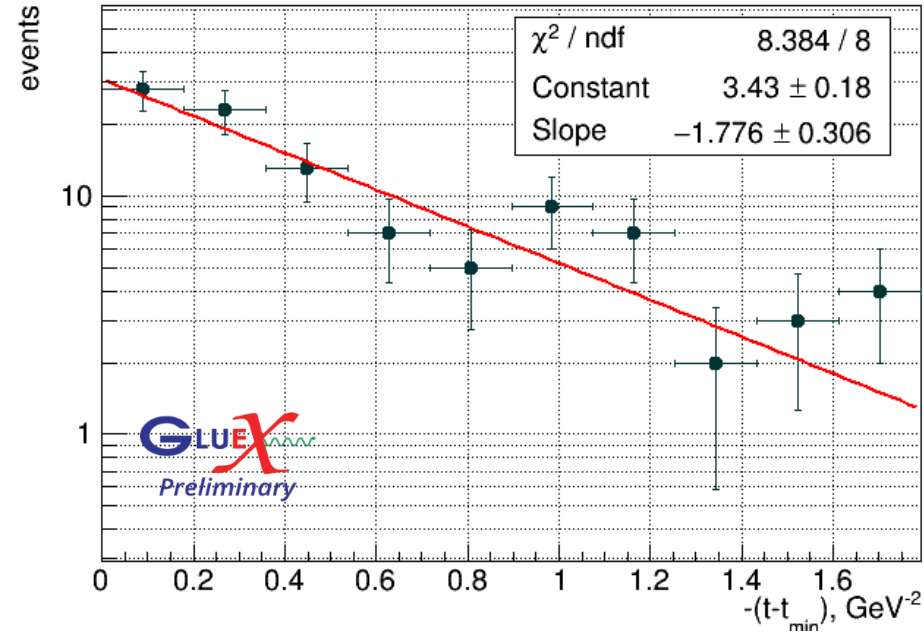

Di-electron Spectrum – J/ψ

$\gamma p \rightarrow p e^+ e^-$

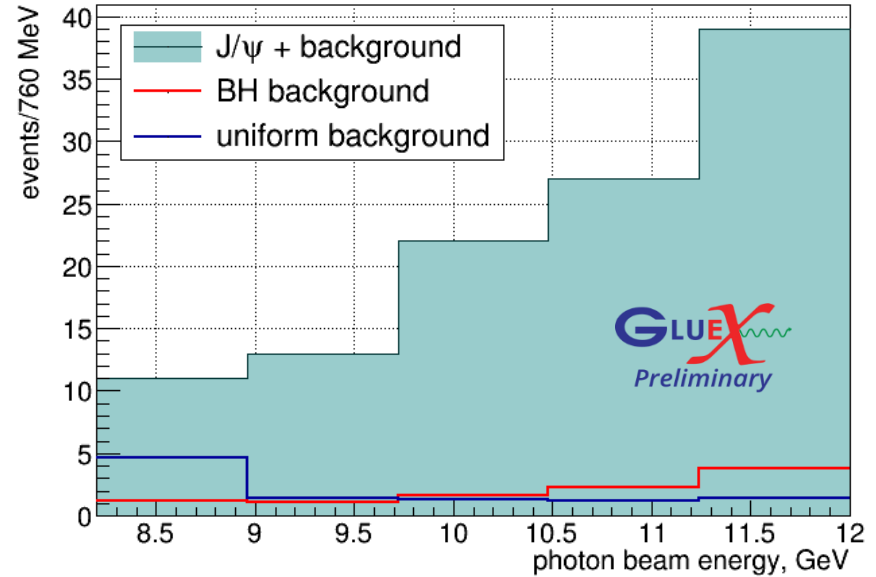

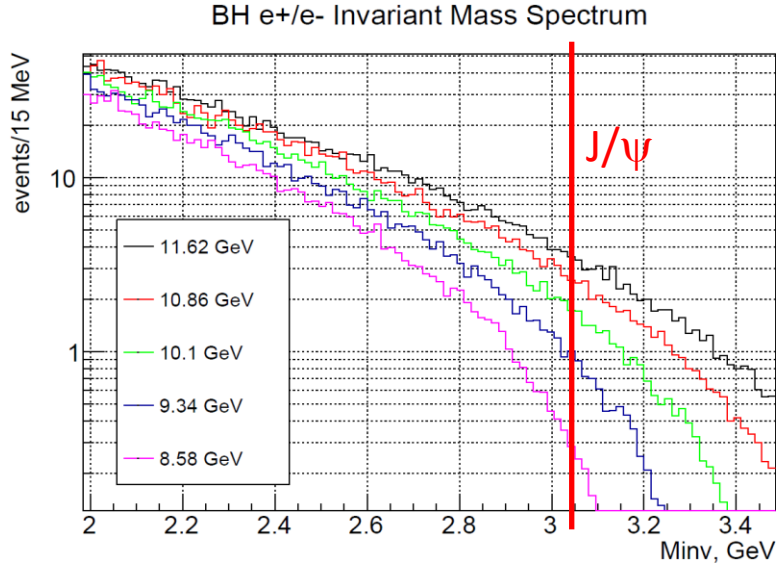

$\gamma p \rightarrow J/\psi p$ t-dependence

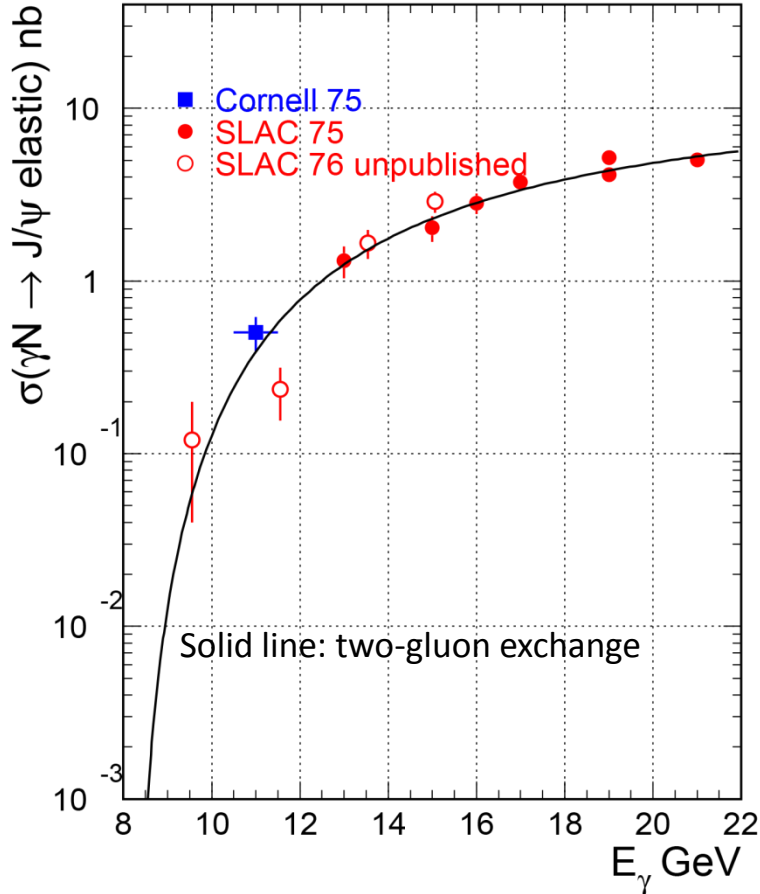

- GlueX has uniform acceptance down to t_{\min} ($< 10\%$ variations); t_{\min} ranges 0.25-1.5 GeV^2
- Average (4.14-4.9 GeV W-range) t-slope of $-1.8 \pm 0.3 \text{ GeV}^{-2}$ in agreement with other (mostly high-energy) measurements

$\gamma p \rightarrow J/\psi p$ - beam energy dependence

Total background under the peak (12 events out of ~100) distributed over the energy bins assuming BH energy dependence (left plot), or uniformly – doesn't make significant difference for the J/ ψ energy dependence

$\gamma p \rightarrow J/\psi p$ cross-section vs beam energy – existing data

Total elastic cross-section extracted from $d\sigma/dt$ measurements on nuclear targets and re-normalized to total cross-section on proton:

- SLAC data (on data on deuterium target) assuming t -slope of 2.9 GeV^{-2}
- Cornell data (on Be target) with t -slope of 1.25 GeV^{-2}

Brodsky et al. [PLB 498, 23 (2001)]

$\gamma p \rightarrow J/\psi p$ cross-section vs beam energy – existing data

Total elastic cross-section extracted from $d\sigma/dt$ measurements on nuclear targets and re-normalized to total cross-section on proton:

- SLAC data (on data on deuterium target) assuming t -slope of 2.9 GeV^{-2}
- Cornell data (on Be target) with t -slope of 1.25 GeV^{-2}

Brodsky et al. [PLB 498, 23 (2001)]

$\gamma p \rightarrow J/\psi p$ cross-section vs beam energy - GlueX

Total elastic cross-section on proton extracted from GlueX data **shown without absolute normalization.**

The energy slope of the GlueX data, that extends down to the threshold, can be compared to the two calculations (curves normalized to data for comparison)

$\gamma p \rightarrow J/\psi p$ cross-section vs beam energy - GlueX

Total elastic cross-section on proton extracted from GlueX data **shown without absolute normalization.**

The energy slope of the GlueX data, that extends down to the threshold, can be compared to the two calculations (curves normalized to data for comparison)

$\sigma(\gamma N \rightarrow J/\psi \text{ elastic})$ ARBITRARY UNITS

$\gamma p \rightarrow J/\psi p$ cross-section vs beam energy - GlueX

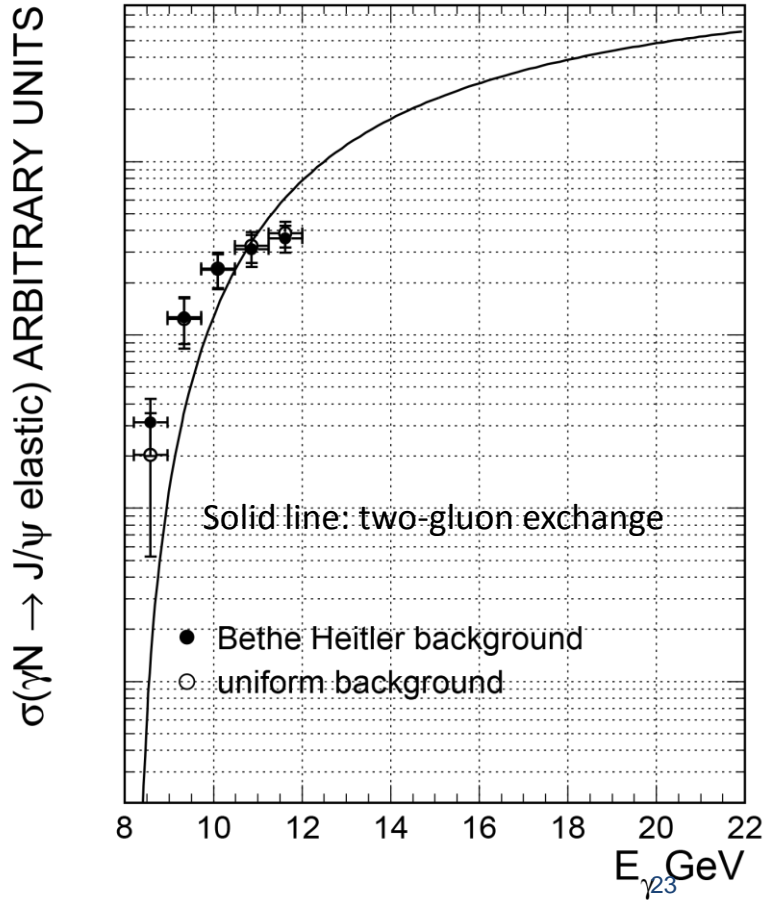

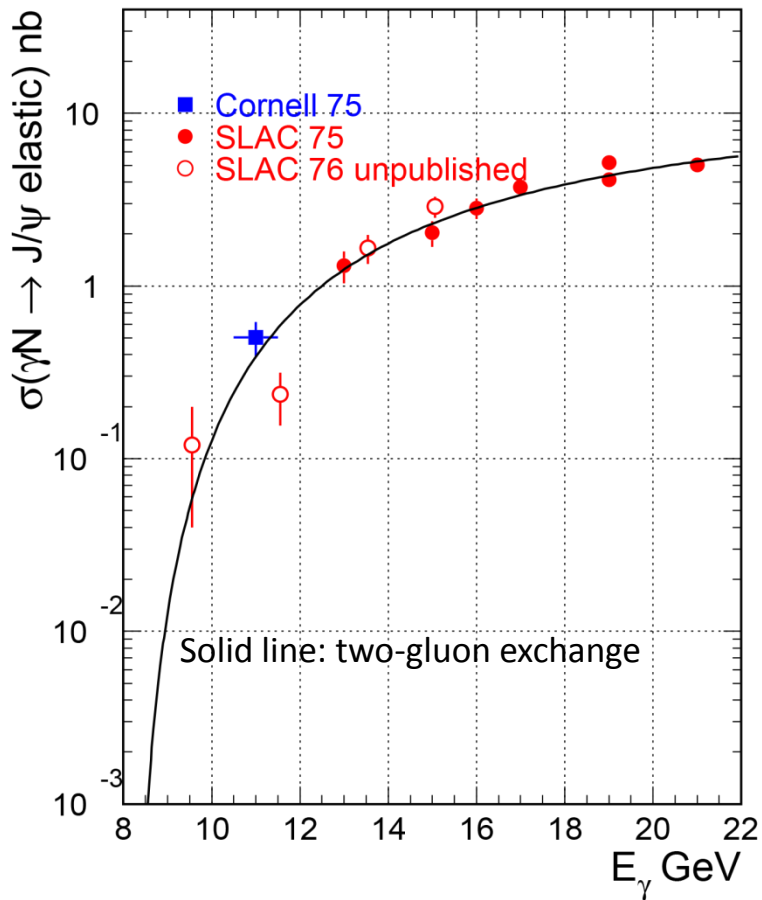

Total elastic cross-section on proton extracted from GlueX data **shown without absolute normalization.**

The energy slope of the GlueX data, that extends down to the threshold, can be compared to the two calculations (curves normalized to data for comparison)

No structure visible at $E_\gamma = 10.02$ GeV, expected position of LHCb pentaquark

$\gamma p \rightarrow J/\psi p$ cross-section vs beam energy

$\gamma p \rightarrow J/\psi p$ cross-section vs beam energy

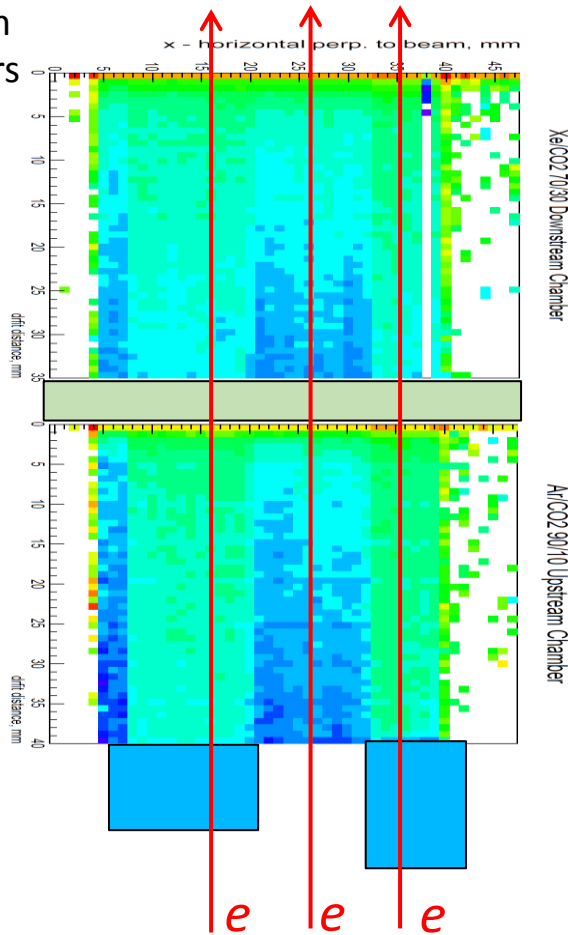

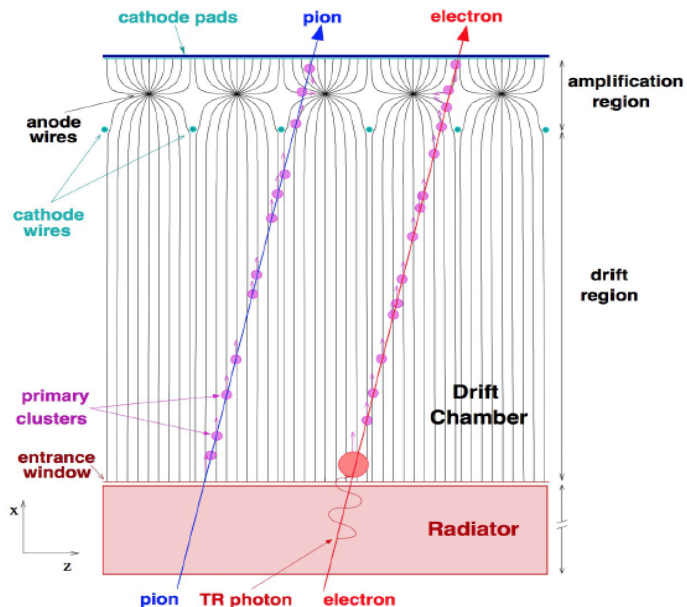

Outlook

- Preliminary results from engineering running (\sim two weeks 10^7 γ/s) demonstrate the possibility for di-electron spectrum studies – J/ψ , ϕ , Bethe-Heitler, ...
- High resolution (10 MeV) for J/ψ invariant mass - result of precise beam energy knowledge, detection of recoil proton, and electron identification
- Measurements of elastic J/ψ photoproduction *extended for the first time down to the threshold*
- In the first physics run (that starts now) *expect to increase the J/ψ statistics by a factor 2 to 4*, thus being able to better distinguish between different near threshold production mechanism
- In the future GlueX runs expect to have enough statistics to use the photon polarization and study polarization observables for the di-electron spectrum

Back-ups

Transition Radiation Detector – R&D studies for forward e/π separation

- e/π separation: for $p > 1.5$ GeV, p suppression factor 100-1000 depending on # of chambers
- Prototype tests done with Ar and Xe gas mixtures, using electrons with/without radiator
- Chamber design similar to ALICE TRD:

Color represents the deposited charge per track

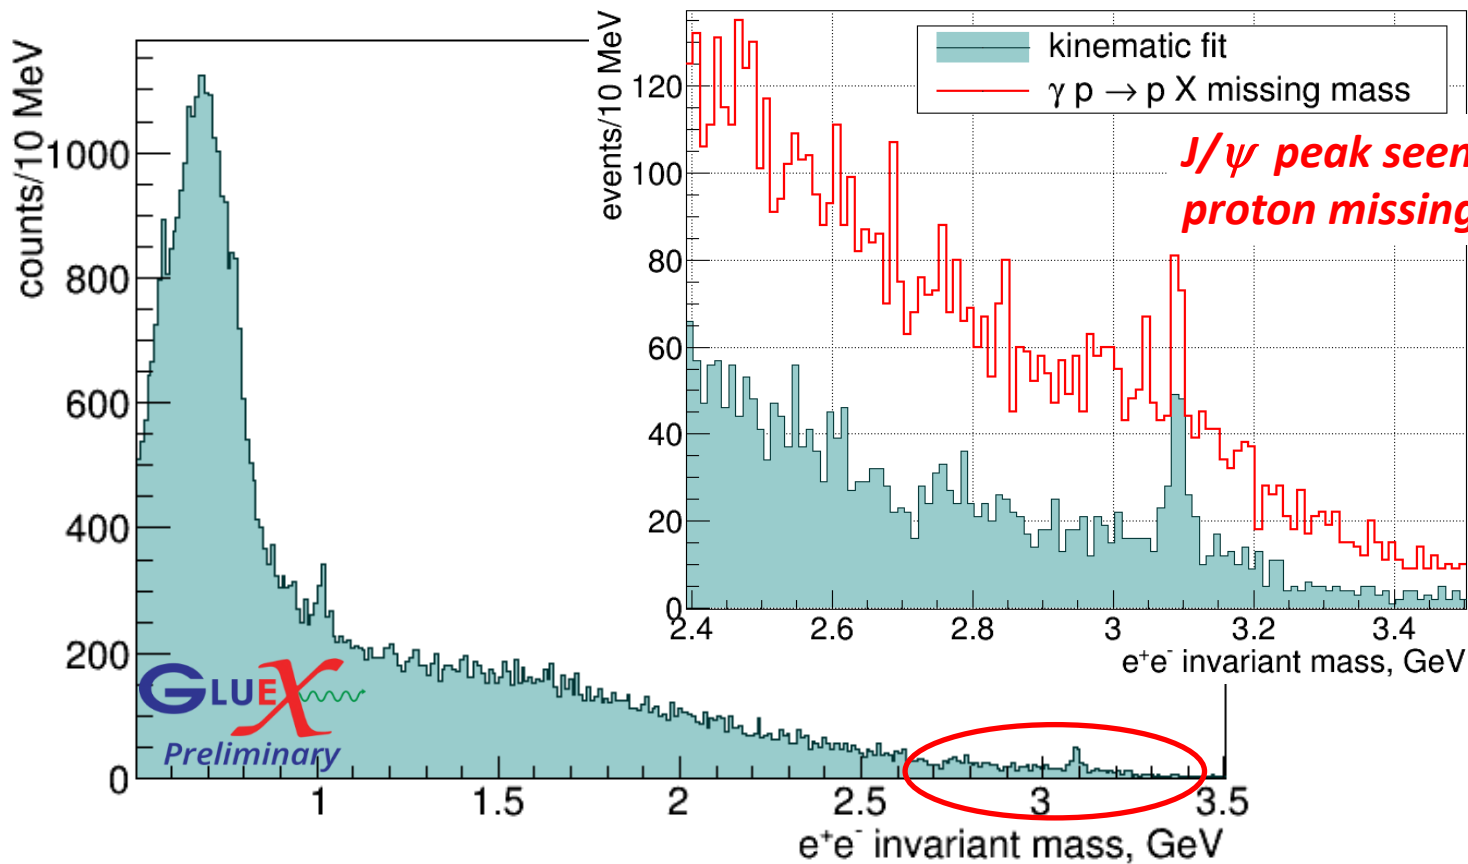

Transition Radiation Detector – R&D studies for forward e/π separation

- Small-scale prototype under tests during the current run
- Using different radiators: conventional one (left) and also Boron Nitride Nanotubes, produced by BNNT company (right):

Boron Nitride Nanotubes

Di-electron Spectrum - J/ψ

Di-electron Spectrum
