# Deep Inelastic cross-section for E12-06-114 

# DVCS collaboration meeting 

26 January 2018

Bishnu Karki

Ohio University, Athens, Ohio

## DIS x-section

- Reproducing DIS cross section ensure our understanding of luminosity and e detection by HRS
$\frac{d^{2} \sigma}{d x d Q^{2}}=\frac{N_{c}}{\mathcal{L}} \times\left(\frac{1}{\alpha \times \eta_{v i r t} \times \eta_{\exp } \times \Gamma_{D I S}}\right)$

Integrated luminosity
a term to modify phase space due to radiative effects
$\eta_{\text {virt }}$ term correcting virtual radiative effects
$\eta_{\text {exp }}$ term correcting detectors inefficiencies
$\Gamma_{\text {DIS }}$ phase space covered by LHRS
$N_{c}$ no. of event passing analysis cut (PID, vertex, track...)

## HRS phase space ( $\Gamma_{\text {DIS }}$ )

Main steps of Monte-Carlo simulation

$$
\begin{gathered}
\Gamma_{D I S}=\frac{1}{N_{g e n}} \sum_{i \in C} \Gamma \dot{M C}_{M C} \\
\Gamma_{M C}^{i}=\frac{\Delta Q_{\mathrm{i}}^{2} \cdot \Delta x_{B}}{2 \pi} \quad \text { DIS phase space }
\end{gathered}
$$

Generating electrons
dvcsPrimaryGeneratorAction::Generate Primaries() gev->GenerateVertex()
gev->ExtBrem()
gev->GenKin()
gev->IntRCBef()
dvcsEventAction::DefinePrimaries()
dvcsEventAction::EndofEventAction()
TGenGeo::HitsSpectro(TLorentzVector *e)

- The Monte-Carlo(MC) simulation for DVCS was modified to generate DIS events
- $\Gamma_{\text {DIS }}$ is estimated by MC simulation
- $\Gamma_{\text {DIS }}$ depends on the HRS acceptance \& R-cut
https://hallaweb.jlab.org/dvcslog/12+GeV/171023_200242/DIS.pdf

## Event selection <br> $\left(\mathrm{N}_{\mathrm{c}}\right)$

## (H.Rashad)

- PID - CherADCSum > 150 + Normalized PRSum>600 + Normalized PR1>200
- Single track - (0M4S + 1M3S)
- Vertex - within the hydrogen
- DIS events - with triggerPatternWord
- Acceptance cut (R-cut from G.Hamad)

| Kinematic | $R$-cut |
| :--- | :--- |
| 361 | 0.1 |
| 362 | 0.06 |
| 363 | 0.06 |
| 481 | 0.05 |
| 482 | 0.06 |
| 483 | 0.05 |
| 484 | 0.05 |
| 601 | 0.06 |
| 603 | 0.02 |

## Modification of the Phase Space due to the Radiative Effects ( $\alpha$ )

- Radiative effects may move events which are outside the small L-HRS acceptance at the vertex into the HRS acceptance.
- We must correct the DIS cross section for for this radiation effects
- To obtain the cross section at the nominal kinematic values, we compute a coefficient $\alpha$

$$
\alpha=\frac{1}{N_{a c c} \times\left(\frac{d \sigma}{d x_{B} d Q^{2}}\right)_{H R S}} \sum_{i=1}^{N_{a c c}}\left(\frac{d \sigma}{d x_{B} d Q^{2}}\right)_{i}
$$

| Kinematic | $\alpha$ |
| :--- | :--- |
| 361 | 1.053 |
| 362 | 0.991 |
| 363 | 1.037 |
| 481 | 1.026 |
| 482 | 1.049 |
| 483 | 0.947 |
| 484 | 0.945 |
| 601 | 0.987 |
| 603 | 1.092 |

## Virtual radiative corrections

## ( $\eta_{\text {viri }}$ )

$$
\begin{gathered}
\eta_{v i r t}=\frac{e^{\delta_{R}^{0}+\delta_{v e r}}}{\left(1-\delta_{v a c}\right)^{2}} \\
\delta_{v a c}=\frac{\alpha}{3 \pi}\left[\ln \left(\frac{Q^{2}}{m_{e}^{2}}\right)-\frac{5}{3}\right], \\
\delta_{v e r}=\frac{\alpha}{\pi}\left[\frac{3}{2} \ln \left(\frac{Q^{2}}{m_{e}^{2}}\right)-2+\frac{\pi^{2}}{6}-\frac{1}{2} \ln ^{2}\left(\frac{Q^{2}}{m_{e}^{2}}\right)\right] \\
\delta_{R}^{(0)}=\frac{\alpha}{\pi}\left[\operatorname{Sp}\left(\cos \frac{\theta_{e}}{2}\right)-\frac{\pi^{2}}{3}-\frac{1}{2} \ln ^{2}\left(\frac{Q^{2}}{m_{e}^{2}}\right)\right]
\end{gathered}
$$

| Kinematics | $\boldsymbol{\eta}_{\text {virtual }}$ |
| :--- | :--- |
| 361 | 1.070 |
| 362 | 1.071 |
| 363 | 1.072 |
| 481 | 1.069 |
| 482 | 1.072 |
| 483 | 1.073 |
| 484 | 1.074 |
| 601 | 1.073 |
| 603 | 1.075 |

## Detector efficiencies

## $\left(\eta_{\text {exp }}\right)$

- Cherenkov efficiency $\left(\boldsymbol{\eta}_{\text {cher }}\right)$ - special runs triggered by S0\&\&S2M $\sim 1$
- S2M efficiency $\left(\mathbf{n}_{\mathrm{s} 2 \mathrm{~m}}\right)$ - special runs triggered by S0\&\&S2M ~1
- Tracking efficiency $\left(\boldsymbol{\eta}_{\text {track }}\right)$ - (from H. Rasad) - Major correction ( $\sim$ \% correction)
- 3 cases: 0M4S, 1M3S, and 2M2S events yields single track reconstruction. Keep OM4S and 1M3S exclude 2M2S
> $-5-10 \%$ events are reconstructed with more than one track and are excluded
$\eta_{\text {MultiCluster }}=1+\frac{N_{2 M 2 \text { S Electrons }}}{N_{(0 M 4 \mathrm{~S}+1 \text { M3S }) \text { Electrons }}}$

$$
\eta_{\text {MultiTrack }}=1+\frac{N_{\text {MultiTrack Electrons }}}{N_{(0 M 4 S+1 M 3 S)} \text { Electrons }}
$$

Multi-cluster and Multi-track correction factors are mutually exclusive

$$
\eta_{\text {Final }}=\eta_{\text {Multicluster }}+\eta_{\text {Multitrack }}
$$

$$
\eta_{e x p}=\eta_{t r a c k} \times \eta_{C h e r} \times \eta_{s 2 m}
$$

## Detector efficiencies ( $\eta_{\text {exp }}$ ) <br> H. Rasad

| Kinematic | $\boldsymbol{\eta}_{\text {Final }}$ |
| :--- | :---: |
| 361 | 0.940 |
| 362 | 0.936 |
| 363 | 0.930 |
| 481 | 0.957 |
| 482 | 0.937 |
| 483 | 0.943 |
| 484 | 0.940 |
| 601 | 0.937 |
| 603 | 0.936 |

Tracking correction ~7\% correction

## Integrated luminosity

$$
\mathcal{L}=\frac{Q}{e} \frac{N_{A} \rho l}{A_{H}}
$$

Q Charge measured by D3

$$
\mathrm{N}_{\mathrm{A}}=\text { Avogardo's No. }=6.022 \times 10^{23} \mathrm{~mol}^{-1}
$$

$\boldsymbol{\rho}=$ density of H at $\mathbf{1 7} \mathrm{K}$ and $25 \mathbf{p s i}=0.07229 \mathrm{~g} / \mathrm{cm}^{3}$
$\mathrm{I}=$ length of target $=\sim 13 \mathrm{~cm}$
$\mathrm{e}=$ electronic charge $=1.602 \times 10^{-19} \mathrm{C}$
$A_{H}=$ atomic mass of $\mathrm{H}=1.0079 \mathrm{~g} / \mathrm{mol}$

| Period | Kinematic | Z end) <br> $(\mathrm{cm})$ | Z end <br> $(\mathrm{cm})$ | Length <br> $(\mathrm{cm})$ |
| :--- | :--- | :--- | :--- | :--- | | Offset |
| :--- |
| $(\mathrm{cm})$ |

## Z vertex

## H. Rashad

## DIS x-section status

- E12-06-114 DIS cross section compared to world data from M. E. Christy et al. Phys. Rev. C81, 055213 (2010)
- Upto 5\% uncertainty in reference cross-section

| Period | Kinematic | Relative <br> difference(\%) |
| :--- | :--- | :--- |
| Fall 2014 | 361 | -2 |
| Fall 2016 | 362 | -8 |
| Fall 2016 | $363^{\star}$ | -15 |
| Spring 2016 | $481^{* *}$ | -2 |
| Spring 2016 | 482 | -7 |
| Spring 2016 | 483 | -5 |
| Spring 2016 | 484 | -6 |
| Fall 2016 | $601^{* *}$ | -5 |
| Fall 2016 | 603 | +3 |

* Q1 saturation effect
** atypical run to run stability

## Kin 362

DIS Xsection Kin 362

## Kin 482

Before missing correction
Current normalized DIS rates

After missing correction

DIS Xsection Kin 484

- Missing DIS = Exclusive S0\&CER + S0, CER, S2M (in singles) + S2M\&CER Coinc
- Corrected DIS = DIS rates + Missing DIS
$\frac{d^{2} \sigma}{d Q^{2} d x}$
Stable within $2 \%$ even for the multiple coincidence trigger with SO\&CER
- S0, CER, S2M (in singles) = "(triggerPatternWord \&0x3f > 50"
- S2M\&CER Coincidence = "DL.t3"

## Kin 363

DIS Xsection Kin 363

~ 15\% systematically below than the reference cross section
But very stable with in 1\%

## Z vertex reconstruction for Fall 2016 kinematics

Outcomes of previous discussions will be implemented in near future

## Kin 481

Test run results from Fall 2016 (kin 362)

| Run | So\&CER | $\left(\frac{d^{2} \sigma}{d Q^{2 d x}}\right)_{\text {Exp }}$ |
| :--- | :--- | :--- |
| 14174 | 0 | $19.11 \pm 0.08$ |
| 14183 | 2 | $18.88 \pm 0.09$ |

Corrected DIS works well upto $\sim 1 \%$

For 481 first and second chunk have different prescale both on S0\&\&Cer and S2M\&\&Cer
Prescale on SO\&CER do not explain the observed ~8\% discrepancy

## Kin 481

## DIS and Missing events

## Kin 601

- Discriminator for S2 was replaced beyond 14325 (https://logbooks.jlab.org/entry/3436133)
- Does not explain this discrepancy
- No any other major changes in kin 601

## Beam energy variation

M. E. Christy et al. Phys. Rev. C81, 055213 (2010)

| Kinematic | Reference | $\mathbf{+ 0 . 5 \%}$ | $\mathbf{- 0 . 5 \%}$ |  |
| :--- | :--- | :--- | :--- | :--- |
| 361 | 28.04 | 0.4 | 0.7 | $+0.5 \%$ |
| 362 | 20.79 | 0.5 | 0.5 | $0.5 \%$ |
| 363 | 13.19 | 0.7 | 0.8 | $-0.5 \%:$ Beam E increased by |
| 481 | 19.60 | 0.5 | 0.5 | $0.5 \%$ |
| 482 | 7.62 | 0.0 | 0.0 |  |
| 483 | 4.58 | 0.7 | 0.4 |  |
| 484 | 2.55 | 0.8 | 0.8 |  |
| 601 | 2.05 | 0.5 | 0.2 |  |
| 603 | 0.70 | 0.5 | 0.4 |  |

$$
\frac{d^{2} \sigma}{d Q^{2} d x}\left(\mathrm{E}, \theta, \mathrm{k}^{\prime}\right) \text { in order of } 10^{-6} \mathrm{Gev}^{-4}
$$

The cross-section changes by less than $1 \%$ when beam energy is change by $0.5 \%$
Change in beam energy does not explain the observed discrepancy in kin 481 and 601

## Conclusion and Outlook

- DIS cross run by run stable for most kinematic (<2\%)
- Suggestion from previous discussion can be implemented and reanalyzed for 363 or Fall 2016 data
- Check detector efficiencies for problematic runs kin 601 and 481
- Target offset re-analysis

## THANK YOU!

## Zvertex and phi

kin 362

kin 363

## Rotation for kin 363

Zrotated $=$ z+(slope* phi)

## pointing runs (after rotation 363 only)

Position of foils
