

Partial Wave Analysis for Electron-Positron and Antiproton-Proton Annihilations

M. Albrecht, B. Kopf, X. Qin

Ruhr-Universität Bochum
Institut für Experimentalphysik I

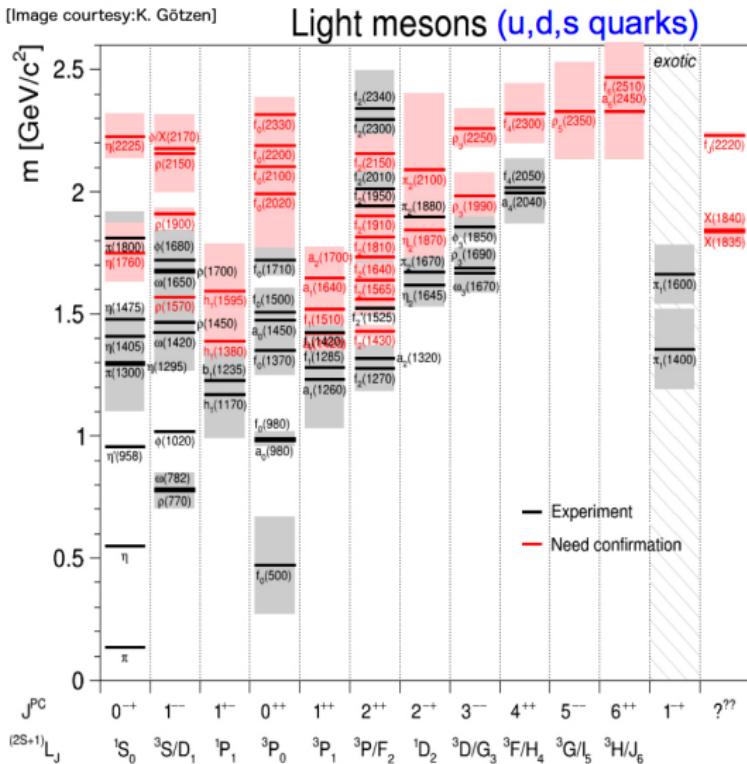

8th Workshop of the APS Topical Group on Hadronic Physics
April 10th 2019

- ▶ Challenges in Meson Spectroscopy
- ▶ Description of Resonances
- ▶ PArtial Wave Interactive ANalysis Software *PAWIAN*
- ▶ Isolated Resonances
 - ▶ $e^+e^- \rightarrow J/\psi \rightarrow \gamma\omega\omega$
- ▶ Overlapping Resonances in Multiple Channels
 - ▶ Coupled Channel Analysis of $\bar{p}p \rightarrow (K^+K^-\pi^0), (\pi^0\pi^0\eta), (\pi^0\eta\eta)$
- ▶ Summary

Challenges in Meson Spectroscopy

- ▶ Many broad and overlapping states discovered
- ▶ Theoretical predictions do not match observed states
- ▶ Assignment to $q\bar{q}$ multiplets still ambiguous
- Fundamental to gain deeper understanding of strong interaction
- Optimally: Combine different production processes and decay modes!

Description of Resonances

- ▶ Breit-Wigner parameterization most commonly used. OK, if resonance is
 - ▶ isolated
 - ▶ appearing only in one channel
 - ▶ far away from thresholds
- ▶ *What if these requirements are not fulfilled?*
- More sophisticated descriptions required
- ▶ We use: K -matrix parameterization with consideration of analyticity & unitarity:
 - ▶ S -matrix describes two-body scattering process via $S = I + 2i\sqrt{\rho}T\sqrt{\rho}$
 - ▶ Where T can be written as $T = (I - iK\rho)^{-1}K$
 - ▶ Elements of the K -matrix: $K_{ij} = \sum_{\alpha} \frac{g_{\alpha i}g_{\alpha j}}{m_{\alpha}^2 - s} + \sum_k c_{kij}s^k$
 - ▶ Extension of formalism to production of resonances using P -vector approach: [I.Aitchison, Nucl.Phys.A 189 (1972) 417]
 - ▶ Dynamical function becomes: $F = (I - iK\rho)^{-1}P$ with $P_i = \sum_{\alpha} \frac{\beta_{\alpha}g_{\alpha i}}{m_{\alpha}^2 - s} + \sum_k c_{kis}s^k$
 - ▶ Replace standard phase-space factors ρ with function to respect constraints from analyticity
(Chew-Mandelstam function [Basdevant, Berger PRD19 (1979) 239])

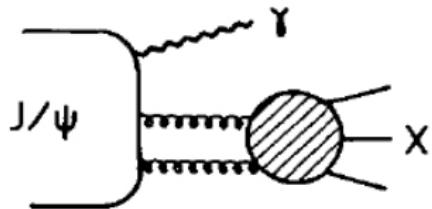

PArtial Wave Interactive ANalysis Software (PAWIAN)

- ▶ PWA software package under development in Bochum to ...
[B. Kopf et. al., Hyperfine Interact. 229 (2014) no.1-3, 69-74]
 - ▶ provide a generic (amplitudes, dynamics, ...) easy-to-use software package (GPLv3)
 - ▶ support different production processes ($\bar{p}p$, e^+e^- , $\gamma\gamma$, ...)
- ⇒ Several analyses have already been performed
- ⇒ PAWIAN features full configuration of hypotheses and other input settings via plain-text configuration files
 - ▶ Spin-formalism (Canonical, Helicity)
 - ▶ Decay dynamics (Breit-Wigner, Flatté, K -matrix)
- ⇒ Event based maximum likelihood fits (Minimizer: MINUIT2, ...)
- ⇒ Event generator, histogramming, analysis tools, ...
- ⇒ Coupled channel analyses supported
- ⇒ Parallelization: Multi-threading and server-client (network) modes

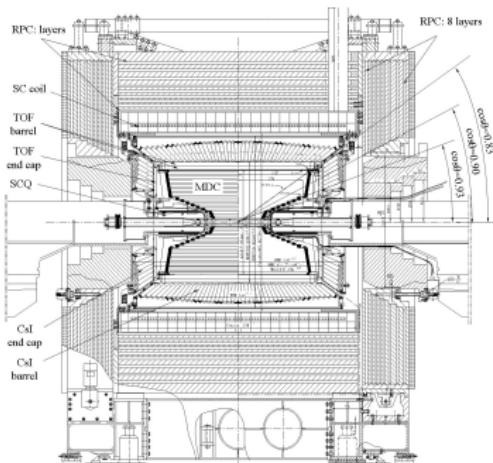

Electron-Positron Annihilation: BESIII@BEPCII

- ▶ Experiment at symmetric e^+e^- collider in Beijing
 - ▶ Energy range: $\sqrt{s} = 2.0 - 4.6 \text{ GeV}$
 - ▶ BESIII has recorded the worlds largest J/ψ and ψ' data sets:
 - ▶ $1.3 \cdot 10^9 J/\psi$ events
 - ▶ $(10 \cdot 10^9 J/\psi$ to come soon!)
 - ▶ $0.5 \cdot 10^9 \psi'$ events
- ⇒ Ideally suited to perform hadron spectroscopy with high statistics

- ▶ Main Drift Chamber
- ▶ Time of Flight System
- ▶ Electromagnetic CsI(Tl) Calorimeter
- ▶ Superconducting Solenoid (1T)
- ▶ RPC muon chambers

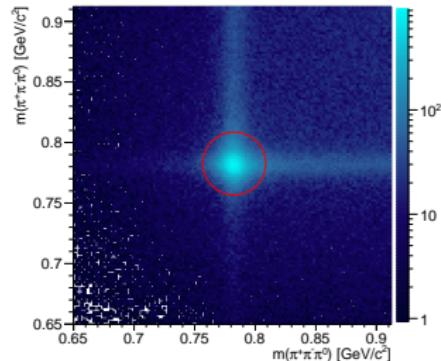

Event Selection: $J/\psi \rightarrow \gamma\omega\omega$, $\omega \rightarrow \pi^+\pi^-\pi^0$, $\pi^0 \rightarrow \gamma\gamma$

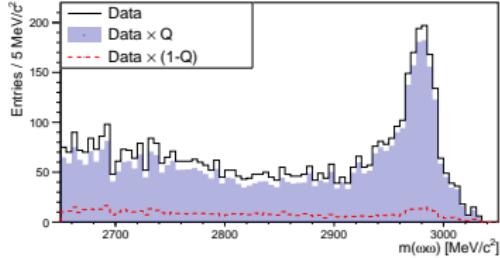

- ▶ Investigation of contributions to the $\omega\omega$ system
- Highlight today: Observation of $\eta_c \rightarrow \omega\omega$
- ▶ CLEOc, KEDR: Interference between η_c and non-resonant background in radiative charmonium decays
- Utilize PWA in η_c mass region to measure $B(\eta_c \rightarrow \omega\omega)$
- Clean event selection is crucial

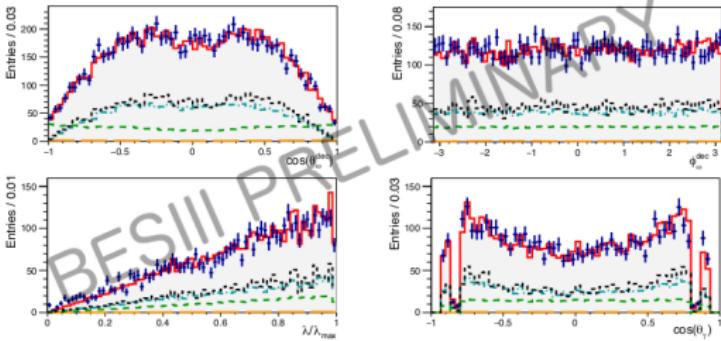

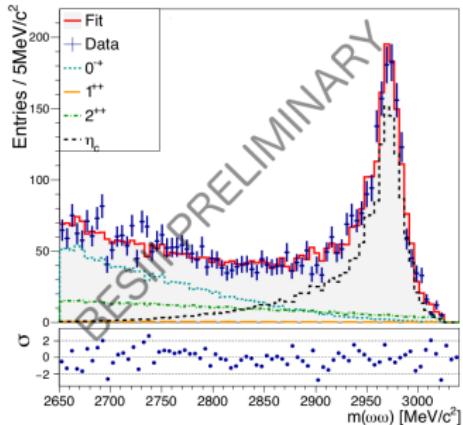

- ▶ Event-based background subtraction using Q -factor method
[JINST 4, P10003 (2009)]
- Result: 4900 $\omega\omega$ events in η_c region
- Clear η_c signal

Preselected events (Data)

Background subtracted events (Data)

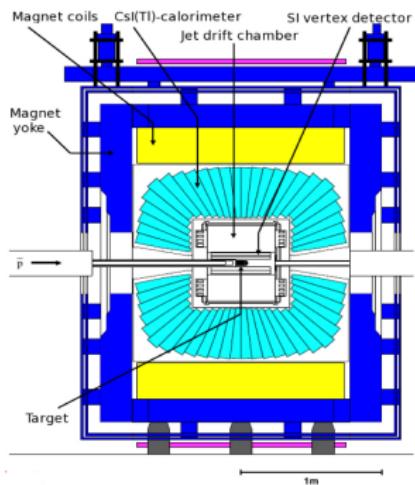

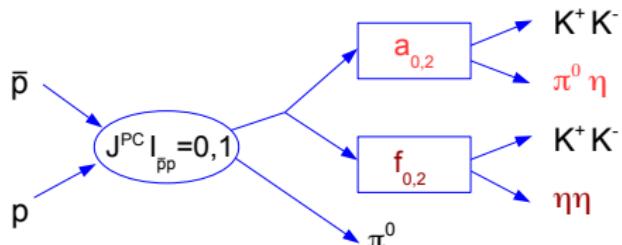

- ▶ η_c line shape is distorted in radiative decays
- ⇒ Sophisticated parameterization incl. energy dependence of the $M1$ transition matrix element
[Phys. Rev. Lett. 102 011801 (2009)]
[Phys. Rev. D73 054005 (2006)]
- ▶ PWA to account for interference
- ▶ First measurement of this branching fraction

Coupled Channel Analysis: $\bar{p}p \rightarrow K^+K^-\pi^0, \pi^0\pi^0\eta, \pi^0\eta\eta$

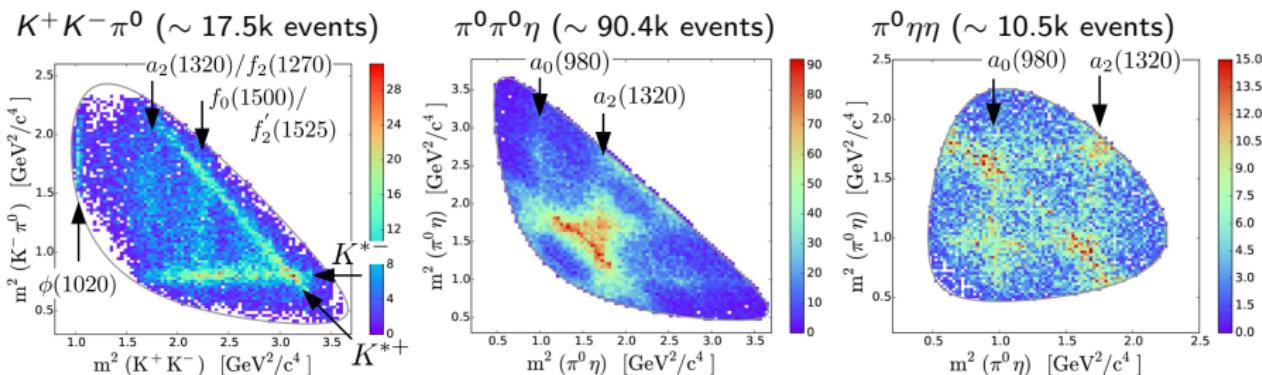

- ▶ Fixed target experiment at LEAR (CERN)
- ▶ Data taking: 1989-1996
- ▶ $\bar{p}p$ annihilation in flight and at rest
- ▶ $p_{\bar{p}} = (0.105...2.0) \text{ GeV}/c$
⇒ Momentum overlap with \bar{p} ANDA !

- ▶ Many $f_{0,2}$ and $a_{0,2}$ appear in two or all three channels
- ▶ Exotic candidate $\pi_1(1400)$ only seen in $\bar{p}p$ data at rest
→ Also visible in flight?
- ▶ Coupled analysis enables to distinguish a and f resonances:

- ▶ Simultaneous fit of $\bar{p}p \rightarrow K^+K^-\pi^0$, $\pi^0\pi^0\eta$, $\pi^0\eta\eta$ channels
- Advantages: Common amplitudes, common description of the dynamics (K -matrix), less fit parameters
- ▶ Clean data samples were prepared at $p_{\bar{p}} = 0.9 \text{ GeV}/c$
- ▶ Kinematic fits, event-based background subtraction

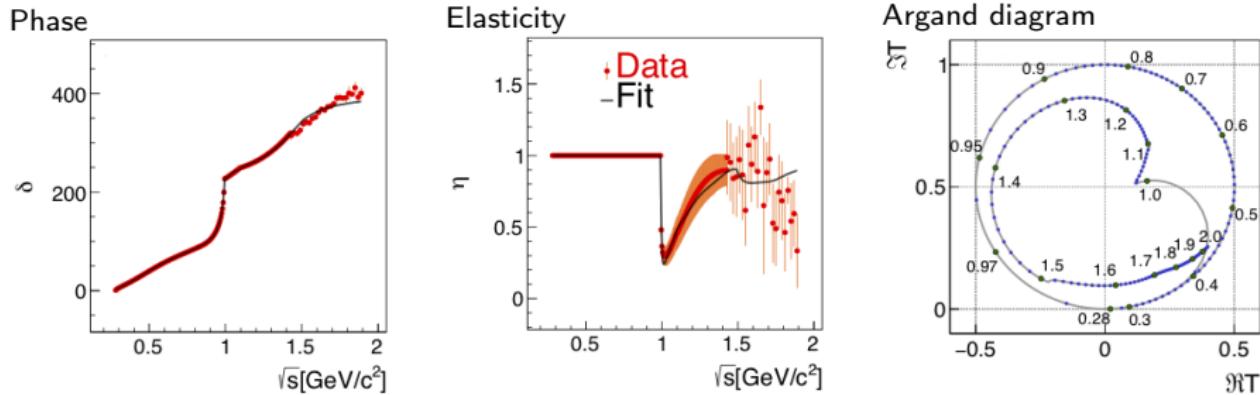

- ▶ Additional constraints by coupling to **scattering data** (phase & elasticity):
 - ▶ $I = 0$ $S-$ and $D-$ wave $\pi\pi \rightarrow \pi\pi, K\bar{K}, \eta\eta (\eta\eta')$,
 - ▶ $I = 1$ $P-$ wave $\pi\pi \rightarrow \pi\pi$

PRD 83 (2011) 074004, Nucl.Phys.B 64 (1973) 134-162,
Nucl.Phys.B 269 (1986) 485, Nuov.Cim.A 80 (1984) 363

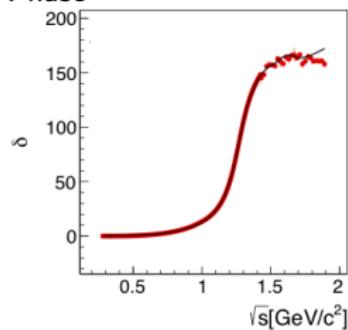

- ▶ f_0 K-Matrix: 5-poles, 5-channels
- ▶ f_2 K-Matrix: 4-poles, 4-channels
- ▶ ρ K-Matrix: 3-poles, 3-channels
- ▶ a_0 and a_2 K-Matrix: 2 poles, 2 channels (each)
- All pole positions and coupling strengths are free parameters!
- ▶ $(K\pi)_S$ -wave K-Matrix: 1-pole, 2-channel [Phys.Lett.B653 (2007) 1-11]
- ▶ Breit-Wigner description for isolated resonances ($\phi(1020)$, $K^{*\pm}(892)$, $\pi_1(1400)$)
- ▶ Overall: Good description of data for $\bar{p}p$ channels and also for scattering data:

$\pi\pi \rightarrow \pi\pi$, $I = 0$ S-wave:

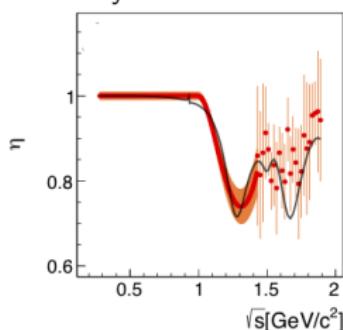

$\pi\pi \rightarrow \pi\pi, I = 0$ D-wave:

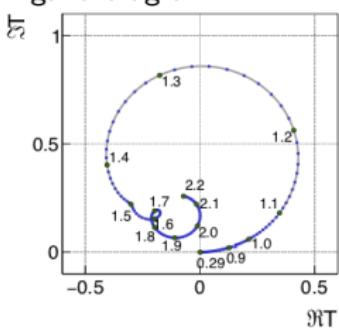

Phase

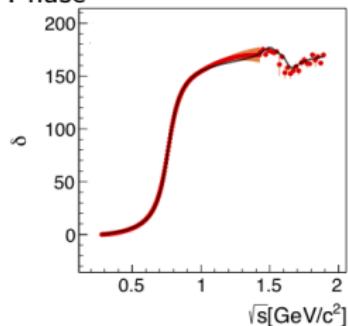

Elasticity

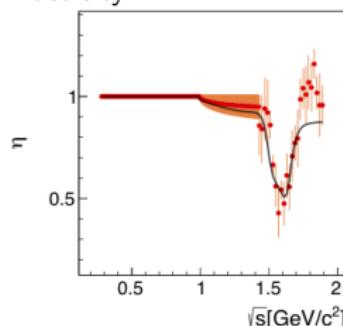

Argand diagram

 $\pi\pi \rightarrow \pi\pi, I = 1$ P-wave:

Fit quality: $p = 0.848$
[Aslan,Zech
NIM A 537 (2005) 626-636]

contribution (in %)	
$f_0 \pi^0$	$15.0 \pm 0.4 \pm 3.0$
$f_2 \pi^0$	$16.1 \pm 0.7 \pm 3.5$
$\rho \pi^0$	$16.1 \pm 1.2 \pm 5.0$
$a_0 \pi^0$	$0.3 \pm 0.0 \pm 1.0$
$a_2 \pi^0$	$7.1 \pm 0.2 \pm 3.0$
$K^*(892)^\pm K^\mp$	$38.5 \pm 1.3 \pm 2.8$
$(K\pi)_S^\pm K^\mp$	$15.6 \pm 0.8 \pm 4.2$
$\phi(1020) \pi^0$	$2.4 \pm 0.3 \pm 0.7$
Σ	$111.0 \pm 2.1 \pm 6.0$

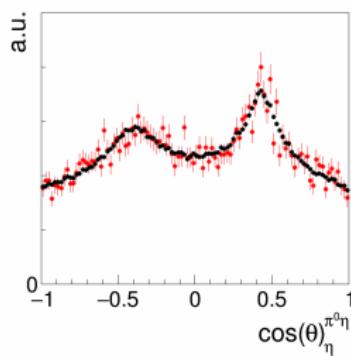

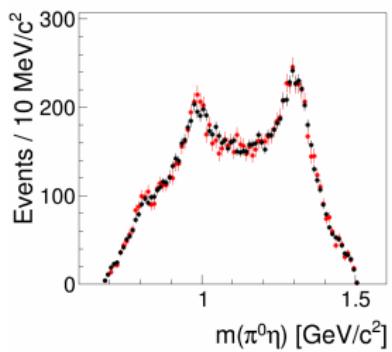

Fit quality: $p = 0.356$

	contribution (in %)
$f_0 \eta$	$23.6 \pm 0.5 \pm 11.0$
$f_2 \eta$	$35.8 \pm 0.6 \pm 5.9$
$a_0 \pi^0$	$22.9 \pm 0.4 \pm 15.0$
$a_2 \pi^0$	$35.4 \pm 0.6 \pm 5.9$
$\pi_1(1400) \pi^0$	$13.2 \pm 0.4 \pm 6.0$
Σ	$130.7 \pm 1.1 \pm 22.7$

Fit quality: $p = 0.478$

	contribution (in %)
$f_0 \pi^0$	49.6 \pm 1.9 \pm 15.4
$f_2 \pi^0$	19.2 \pm 1.2 \pm 6.9
$a_0 \eta$	12.8 \pm 0.7 \pm 4.9
$a_2 \eta$	28.6 \pm 1.5 \pm 5.8
Σ	110.2 \pm 2.8 \pm 14.7

- No significant contribution of $\pi_1(1400) \rightarrow \pi^0\eta$

Extracted Resonance Parameters (Example)

Preliminary

- ▶ All resonance parameters are encoded in the K -matrix
- Masses and width from position of poles in complex plane of the T -matrix (Riemann sheet closest to the physical sheet)
- ≈ 50 resonance properties extracted from this coupled channel fit

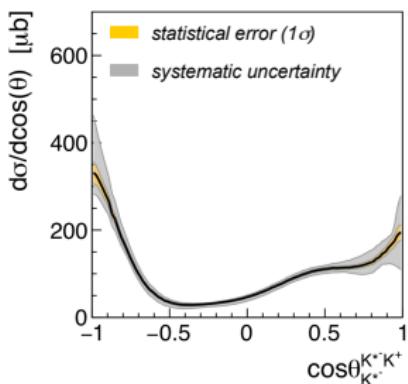

- ▶ Partial widths / branching fractions extracted using the residues of the poles:

$$Res_{k \rightarrow k}^{\alpha} = \frac{1}{2\pi i} \oint_{C_{z_\alpha}} \sqrt{\rho_k} \cdot T_{k \rightarrow k}(z) \cdot \sqrt{\rho_k} dz$$

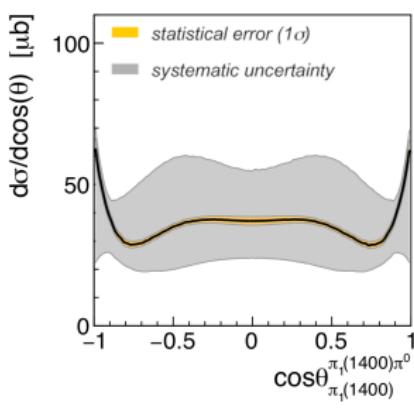

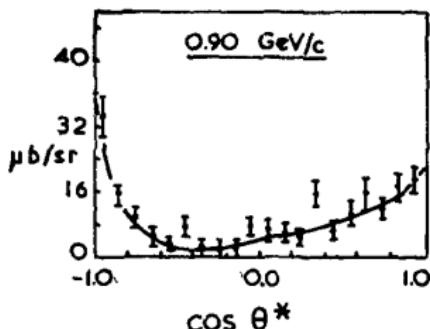

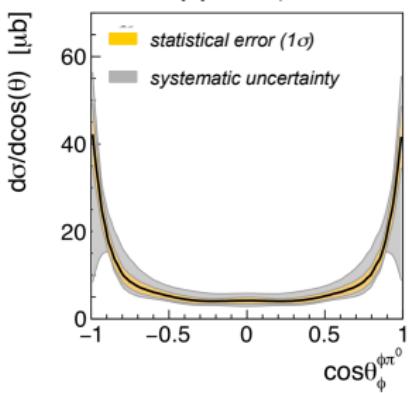

name	pole mass [MeV/ c^2]	pole width Γ [MeV]	$\Gamma_{\pi\pi}/\Gamma$ [%]	Γ_{KK}/Γ [%]	$\Gamma_{\eta\eta}/\Gamma$ [%]
$f_2(1270)$	$1266.5 \pm 0.3 \pm 0.7$	$199.6 \pm 0.5 \pm 11.0$	$88.1 \pm 0.1 \pm 4.5$	$6.6 \pm 0.5 \pm 4.3$	$0.0 \pm 0.4 \pm 0.1$
$f_2'(1525)$	$1507.4 \pm 0.5 \pm 2.8$	$92.5 \pm 1.0 \pm 15.1$	$4.6 \pm 0.8 \pm 2.1$	$48.9 \pm 1.5 \pm 10.0$	$4.5 \pm 1.9 \pm 0.5$
$f_2(1640)$	$1651.8 \pm 1.1 \pm 16.9$	$215.3 \pm 3.0 \pm 20.8$	$18.6 \pm 1.0 \pm 3.7$	$19.8 \pm 3.6 \pm 5.0$	$0.1 \pm 2.3 \pm 0.1$
$f_2(1950)$	$1973.5 \pm 5.2 \pm 31.1$	$448.5 \pm 8.9 \pm 61.9$	$25.5 \pm 1.2 \pm 7.7$	$88.9 \pm 3.0 \pm 11.1$	$0.1 \pm 4.6 \pm 0.1$

Differential Cross Sections

Preliminary

Similar shape
compared to
 $K^+ K^-$?

- ▶ PAWIAN software package is in a good shape
- ▶ e^+e^- annihilations at BESIII:
 - ▶ Large J/ψ and ψ' data sets well suited for light hadron spectroscopy
 - ⇒ Example: First measurement of $\eta_c \rightarrow \omega\omega$ branching fraction
- ▶ $\bar{p}p$ annihilations at Crystal Barrel / LEAR:
 - ▶ Analysis of in-flight $\bar{p}p$ data with relevance for PANDA
 - ⇒ Coupled channel analysis of $\bar{p}p \rightarrow K^+K^-\pi^0$, $\pi^0\pi^0\eta$, $\pi^0\eta\eta$
 - ▶ Significant contribution of the spin-exotic $\pi_1(1400)$ in $\pi^0\pi^0\eta$?
 - ▶ Not shown today: Spin density matrix elements for K^* , ϕ and π_1
- ⇒ Future: Coupling of e^+e^- and $\bar{p}p$ data ⇒ Stay tuned for more results!
