

Hall A Analysis Software

Ole Hansen

Jefferson Lab

Hall A Collaboration Meeting
January 31, 2019

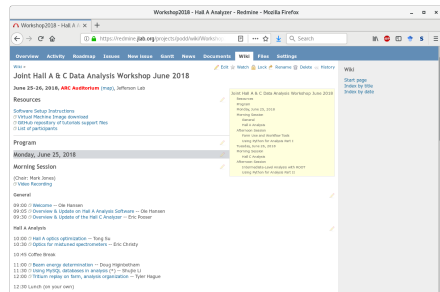

New Home on the Web: Redmine Wiki

- <https://redmine.jlab.org/projects/podd/wiki/>
- Integrated wiki, **bug tracker**, document database and more
- Old website completely migrated (documentation etc.)

Good Starting Point for New Users: Analysis Workshops 2017/2018

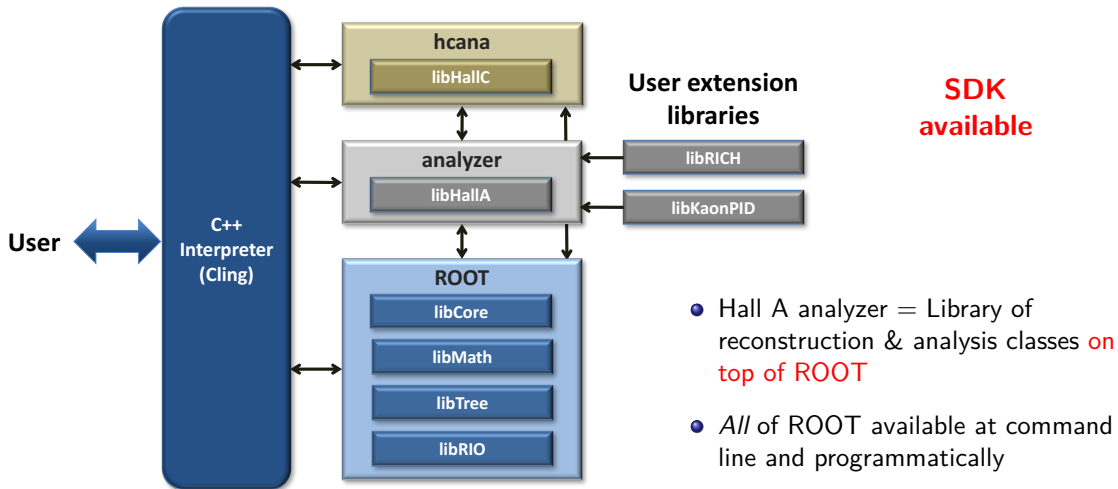

- Joint Hall A & C analysis workshops in summers 2017 & 2018
- Live hands-on tutorials, using preconfigured virtual machine environment
- Simulation, calibration, on- & offline data analysis, ROOT basics, etc.
- BlueJeans recordings available (linked on workshop page, login required)

Hall A C++ Analyzer (“Podd”) Framework

- Design goals:
 - ▶ **Highly modular** to accommodate frequently changing experimental setups
 - ▶ **Run-time configurable**
- C++ class library built on top of **ROOT**. Steering via ROOT’s C++ interpreter.
- Strengths
 - ▶ **Light-weight**: minimal dependencies, small memory footprint
 - ▶ Apparently quite **user-friendly**: students learn easily (but correct me if I’m wrong)
 - ▶ Output & cuts configurable at run time via **text files**. Flat text file database
 - ▶ Works with ROOT 5 & 6, on current and older Linux and macOS
 - ▶ Adequate for Hall A & C-style spectrometer analyses
- Limitations
 - ▶ Designed for one-pass analysis only:
EVIO raw data → Flat ntuple-style ROOT trees + histograms
 - ▶ Single-threaded & not distributed

Plug-In Architecture

Hall A Analyzer Status

- Stable release: **1.6.5** (25 Sep 2018)
 - ▶ Improved VDC track reconstruction (properly handles multi-cluster events)
 - ▶ Modular decoder (Bob Michaels)
 - ▶ Decoder support for pipelined electronics (FADC250, F1TDC, etc.)
 - ▶ New database format
 - ▶ Used extensively by recent Tritium experiments
- Development version: **1.7.0-devel**
 - ▶ Mostly a maintenance release (see next page)
 - ▶ Available on GitHub: <https://github.com/JeffersonLab/analyzer>
 - ▶ ETA: Spring 2019

New in 1.7

- Decoder improvements
 - ▶ Experimental support for **CODA 3 data format and bank data** (Bob Michaels)
 - ▶ **EVIO updated** to version 5.2 (better I/O performance and many bugfixes)
- Contributions from Tritium experiments
 - ▶ Support for decoding FADC data in many detector classes
 - ▶ (TBD)
- Build system overhaul
 - ▶ **CMake build system** added (used by SBS, for example)
 - ▶ SCons build system significantly improved (used by hcana)
 - ▶ Old make system removed
- Extensive “under the hood” code maintenance
 - ▶ **Database API generalized**
 - ▶ HallA and Podd libraries separated
 - ▶ Fixed “defects” found by static code analysis tools (mostly trivial)

Roadmap

- Completed with version 1.7
 - ▶ Database interface
 - ▶ Code reorganization
- Started (probably relevant for SBS)
 - ▶ Output system overhaul (all data types, object variables; 75% done)
 - ▶ **Multithreading** (10% done)
- Nice to have
 - ▶ Unit & integration tests, **test suite**
 - ▶ Metadata & data provenance in output file, self-documenting output
 - ▶ Message facility (consistent log messages)

Output Module Overhaul

Currently:

- Only “D” (Double_t) data type
- Multiple, redundant array size variables with parallel arrays

```

*.....
analyzer [2] █
```

Improved:

- All basic **data types**
- Optional automatic detection of **parallel arrays**, only one size variable (with limitations), saves space
- Optional automatic **basket size adjustment** (overriding ROOT default)

```

```

Parallelization/Multithreading

- **Thread Pool** with three thread-safe queues
- Queues hold working sets: event object, analysis chain & modules
- Option to **sync event stream** at certain events (e.g. scaler events, run boundaries)
- Option to **preserve strict event ordering** (at a performance penalty)
- More advanced designs exist, e.g. task-based dynamic worker allocation (in use at LHC). Podd would not be able to support those.

Summary

- Hall A analysis framework has largely entered **maintenance mode** for the remainder of the HRS era (thru 2020)
- Recent extensive code quality checks did not reveal significant defects. Code is **stable and reliable** and appears to meet the needs of current experiments
- **Upgrade possibilities** exist (as always), some of which will be important for the upcoming SBS program
