CONNECTICUT

 Jefferson Lab

The logo for Jefferson Lab features the text "Jefferson Lab" in a sans-serif font. A red, curved line or swoosh is positioned above the word "Jefferson", starting under the 'J' and ending under the 'n'.

Electron cuts

Nphe vs PCAL edep

ecal vs pcal

- PCAL vs ECAL energy deposits
 - $E_{pcal} > 0.06$
- PCAL vs HTCC response
 - $N_{phe} > 5$

Electron sampling fraction

● electron sampling fraction after other PID cuts

PCAL fiducial cuts

- sampling fraction as a function of U,V,W coordinate

PCAL fiducial cuts

[page=5,width=0.95]figures/pcalFid

- sampling fraction as a function of U,V,W coordinate

Proton PID

Central Detector

β vs momentum

Forward Detector

β vs momentum

β vs momentum

β vs momentum

Vertex distributions

Electron vertex vs ϕ

Proton vertex in Central Detector vs ϕ

Proton vertex in Forward Detector vs ϕ

Particle Identification and Exclusive Selection

MM^2 vs missing energy

MM^2 vs π^0 mass

MM^2 vs angle between calculated and detected pions

- e^- , p , γ , γ using Event Builder pid code
- ban photons along electron direction: $\theta_{e\gamma_1} > 5^\circ$, $\theta_{e\gamma_2} > 5^\circ$
- opening angle between two photons: $\theta_{\gamma_1\gamma_2} > 2$

Particle Identification and Exclusive Selection

- Cut for DIS region: $Q^2 > 2$
- Angle between expected and reconstructed pions: $\theta_{X\pi^0} < 2$
- Missing energy of $(ep \rightarrow e'p'\gamma\gamma X)$ system: $E_{ep\gamma\gamma X} < 0.5$
- Pion mass: $0.07 < M_{\pi^0} < 0.2$
- Missing mass squared of $(ep \rightarrow e'p'X)$ system: $|MM_{epX}^2| < 0.7$

$ihel = -1, 0, 1$ for black, blue and red lines respectively

Kinematic coverage

- $Q^2 > 2$
- ϕ^{tresto} - angle between lepton and hadron planes
- $t = (p' - p)^2$

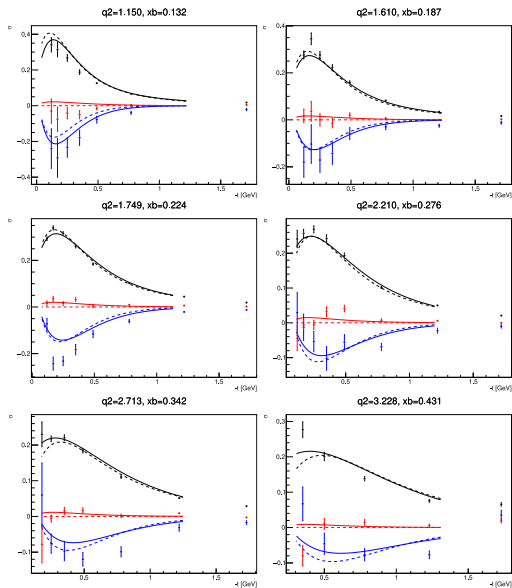

$i_{\text{hel}} = -1, 0, 1$ for black, blue and red lines respectively

π^0/η generator

- π^0 and η generators:
aao_norad
- Cross sections calculations:
 - $W < 1.9$: MAID calculation
 - $W > 1.9$: Deeply Virtual π^0 Production parameterization
- Output: LUND file for CLAS12 GEMC simulation
- need further improvement
- additionally, future efforts to use CLAS12 database for parameterizations

DV π^0 P structure function parameterizations

- Valery's recent fit of existing CLAS6 measurements of structure functions for $ep \rightarrow e' p' \pi^0$
- Comparison of parameterizations from old (dashed line) and new (solid line) fit

Comparison with simulation (momenta)

electron momentum

proton momentum

π^0 momentum

● MC and DATA

Comparison with simulation (azimuthal angle ϕ)

● MC and DATA

Comparison with simulation (polar angle θ)

● MC and DATA

π^0 reconstruction

- low angle π^0
- high angle π^0

Comparison with simulation (improvements)

$\theta_{\pi} > 5^{\circ}$

$\theta_{\pi} > 5^{\circ}$

Comparison with simulation (improvements)

$\theta_\pi > 5^\circ$

$\theta_\pi > 5^\circ$

Comparison with simulation

Kinematic coverage

Kinematic coverage

Q^2 vs x_B

Kinematic dependence (bin = 1)

Kinematic dependence (bin = 2)

Kinematic dependence (bin = 3)

Kinematic dependence (bin = 4)

Kinematic dependence (bin = 5)
