PR12-20-004 PRad-II: *A New Upgraded High Precision Measurement of the Proton Charge Radius*

Haiyan Gao

Duke University

for the PRad Collaboration

JLab PAC 48, August 2020

Spokespersons: D. Dutta, H. Gao, A. Gasparian (contact), D. Higinbotham, N. Liyanage, E. Pasyuk, C. Peng

Outline

- Physics Motivation
- PRad experiment and the results
- Overview of PRad-II
- Proposed measurements and improvements
- Beam request and projected results
- Summary

Proton Charge Radius

- QCD: still poorly understood in non-pQCD region
- Nucleon structure: active areas of research
- Proton charge radius:
  1. A fundamental quantity for proton
  2. Important for understanding how QCD works
  3. An important physics input to the bound state
     QED calculation, affects muonic H Lamb shift
  $(2S_{1/2} - 2P_{1/2})$ by as much as 2%
 1. Critical in determining Rydberg constant

RP, Gilman, Miller, Pachucki, Annu. Rev. Nucl. Part. Sci. 63, 175 (2013).
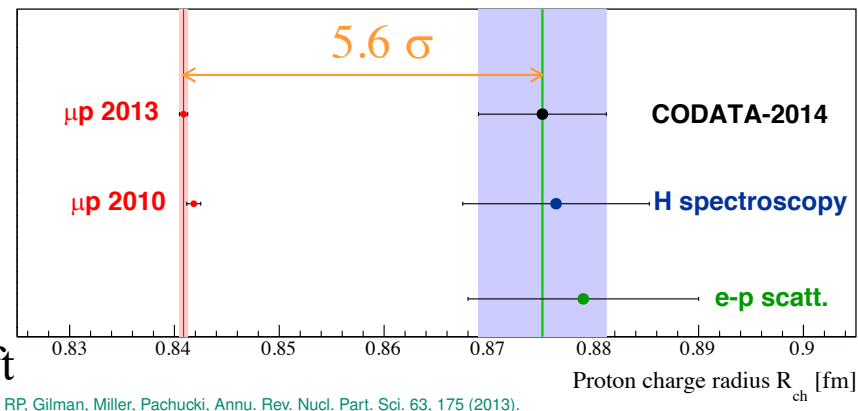

- Methods to measure the proton charge radius:
  1. Hydrogen spectroscopy (atomic physics)
     - Ordinary hydrogen
     - Muonic hydrogen
  2. Lepton-proton elastic scattering (nuclear physics)
     - *ep* elastic scattering (like PRad)
     - *μp* elastic scattering (like MUSE)
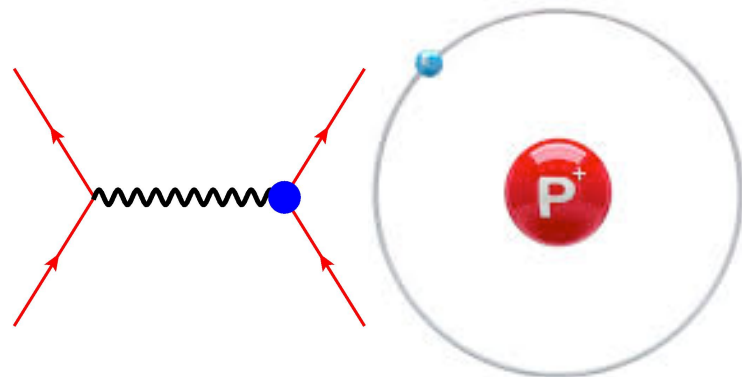

- Important point: the proton radius measured in lepton scattering is defined in the same way as in atomic spectroscopy (G.A. Miller, 2019)

$$\sqrt{<r^2>} = \sqrt{-6\frac{dG(q^2)}{dq^2}\Big|_{q^2=0}}$$

3

PRad: an experiment to help solve the puzzle
- **High resolution, large acceptance, hybrid HyCal calorimeter ($PbWO_4$ and Pb-Glass)**
- **Large-area GEM detector for better position measurement**
- **Windowless H_2 gas flow target**
- **Simultaneous detection of elastic and Moller electrons**
- **Q^2 range of $2\times10^{-4} - 0.06$ GeV^2**
- **Vacuum chamber**

Spokespersons: A. Gasparian (contact), H. Gao, D. Dutta, M. Khandaker

HyCal + GEM

Mainz low Q^2 data set
Phys. Rev. C 93, 065207, 2016
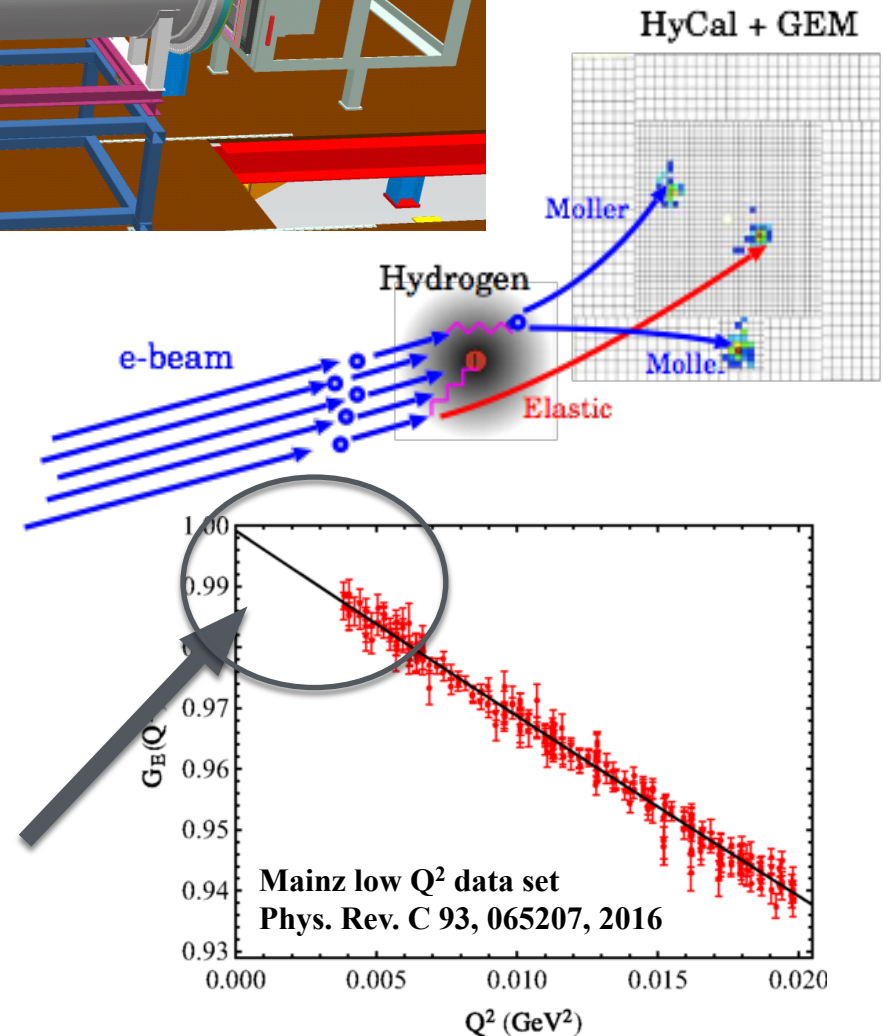

Results from PRad Experiment
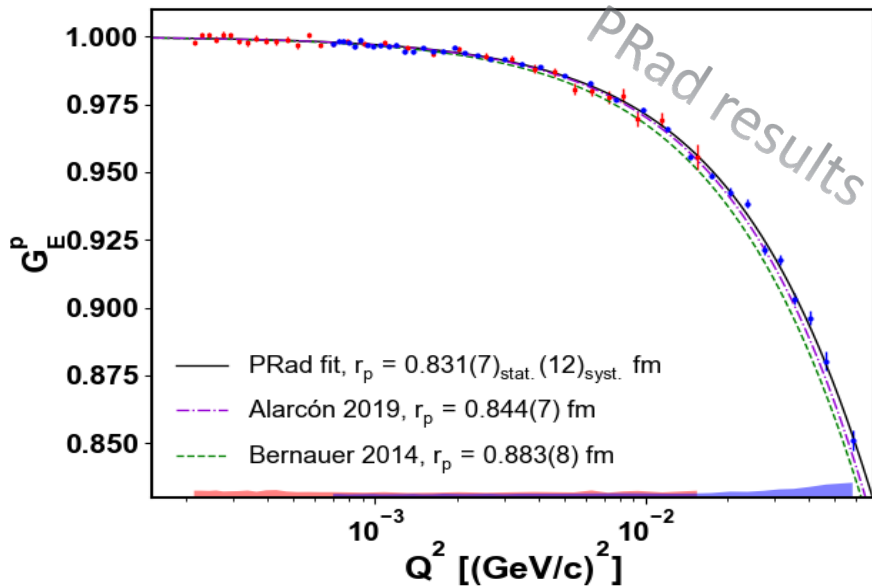

- PRad result $r_p = 0.831$ +/- 0.007 (stat.) +/- 0.012 (syst.) fm supports a smaller radius,
  Xiong *et al.*, *Nature* 575, 147–150 (2019)
- PRad result included in the latest Particle Data Group
- CODATA released (online) revised 2018 value of r_p: 0.8414 +/- 0.0019 fm
- CODATA also shifted the value of the Rydberg constant
- New hydrogen Lamb Shift measurement also supports smaller radius, Bezginov *et al., Science* **365**, 1007-1012 (2019)
Why PRad-II?

- PRad demonstrated the power of magnetic-spectrometer-free calorimetric method for proton charge radius measurement -- *but has not reached its ultimate precision*
- PRad – first electron scattering experiment measured a proton charge radius consistent with muonic results
- PRad proton electric form factor results show systematic difference from those of Mainz (2010) – *higher precision is demanded*
- Is there a possible difference between proton radius from electronic versus muonic system?
  - PRad and two recent hydrogen spectroscopic results show smaller central values than muonic value, albeit with larger experimental uncertainties – *calls for improved precision*
  - Discovery potential?
- Opens a window of opportunities for precision electromagnetic physics at JLab

PRad-II: goals and how?

- Reduce the uncertainty of the r_p measurement by a factor of **3.8!**
- Reach an unprecedented low values of Q^2 : 4×10^{-5} $(GeV/c)^2$ (**endorsed by the theory TAC report**)
- How?
  - Improving tracking capability by adding a second plane of tracking detector
  - Adding new rectangular cross shaped scintillator detectors to separate Moller from ep electrons in scattering angular range of 0.5^0- 0.8^0
  - Upgrading HyCal
    - Replacing lead glass blocks by $PbWO_4$ modules (uniformity, resolutions, inelastic channel)
    - Converting to FADC based readout
  - Suppressing beamline background
    - Improving vacuum
    - Adding second beam halo blocker upstream of the tagger
  - Reducing statistical uncertainties by a factor of 4 compared with PRad
  - Three beam energies: 0.7, 1.4 and 2.1 GeV – *0.7 GeV is critical to reach the lowest Q^2 $(4 \times 10^{-5}$ $(GeV/c)^2)$*
  - Improve radiative correction calculations by going to NNL order
  - Potential target improvement (*not used in projection*)

PRad-II Experimental Setup (Side View)
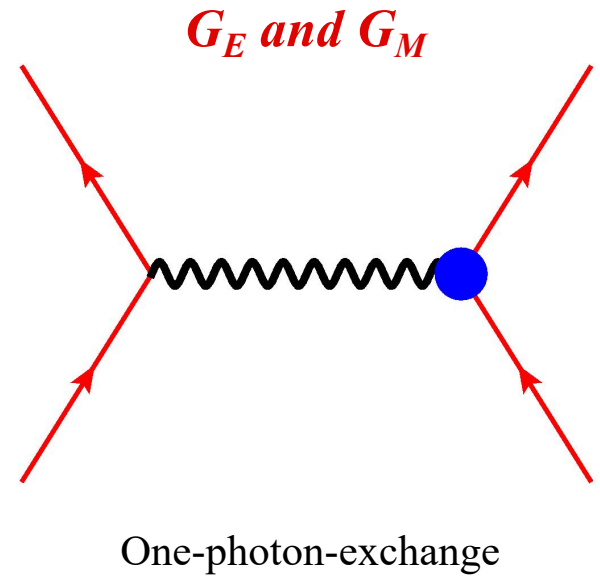

Electron-proton elastic scattering

Unpolarized elastic e-p cross section *(Rosenbluth separation)*

G_E and G_M

$$\frac{d\sigma}{d\Omega} = \frac{\alpha^2 \cos^2\frac{\theta}{2}}{4E^2 \sin^4\frac{\theta}{2}} \frac{E'}{E} \left(\frac{G_E^{p\,2} + \tau G_M^{p\,2}}{1+\tau} + 2\tau G_M^{p\,2} \tan^2\frac{\theta}{2} \right)$$

$$= \sigma_M f_{rec}^{-1} \left(A + B \tan^2\frac{\theta}{2} \right)$$

One-photon-exchange

$$Q^2 = 4EE' \sin^2\frac{\theta}{2} \qquad \tau = \frac{Q^2}{4M_p^2} \qquad \varepsilon = \left[1 + 2(1+\tau)\tan^2\frac{\theta}{2} \right]^{-1}$$

$$G_E^p(Q^2) = 1 - \frac{Q^2}{6}\langle r^2 \rangle + \frac{Q^4}{120}\langle r^4 \rangle + ...$$

$$\langle r^2 \rangle = -6 \left. \frac{dG_E^p(Q^2)}{dQ^2} \right|_{Q^2=0}$$

At low Q² region such as PRad, the cross section is dominated by the G_E^2 term, G_M^2 effect included and systematic uncertainty assigned.

# *Extraction of ep Elastic Scattering Cross Section*

- To reduce the systematic uncertainty, the ep cross section is normalized to the Møller cross section:

$$\left(\frac{d\sigma}{d\Omega}\right)_{ep} = \left[\frac{N_{\exp}(ep \to ep \text{ in } \theta_i \pm \Delta\theta_i)}{N_{\exp}(ee \to ee)} \cdot \frac{\varepsilon_{\text{geom}}^{ee}}{\varepsilon_{\text{geom}}^{ep}} \cdot \frac{\varepsilon_{\text{det}}^{ee}}{\varepsilon_{\text{det}}^{ep}}\right] \left(\frac{d\sigma}{d\Omega}\right)_{ee}$$
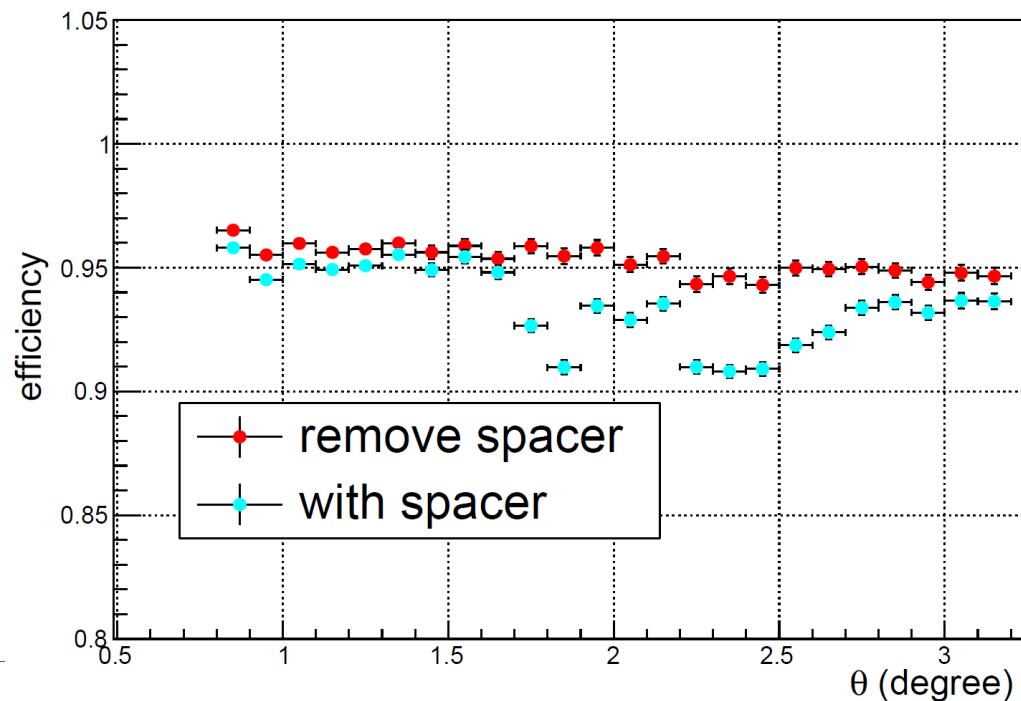

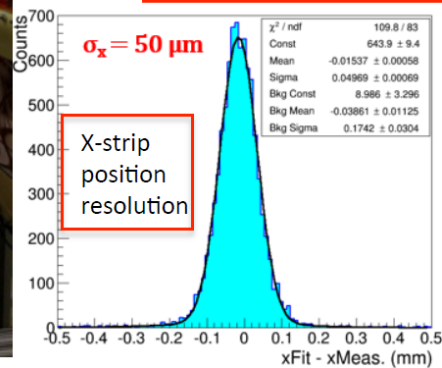

- Method 1: bin-by-bin method – taking *ep/ee* counts from the same angular bin
  - ➢ Cancellation of energy independent part of the efficiency and acceptance
  - ➢ Limited coverage due to double-arm Møller acceptance
- Method 2: integrated Møller method – integrate Møller in a fixed angular range and use it as common normalization for all angular bins
  - ➢ Needs to know the GEM efficiency well
- Luminosity cancelled from both methods
- PRad: Bin-by-bin range: 0.7º to 1.6º for 2.2 GeV, 0.75º to 3.0º for 1.1 GeV. Larger angles use integrated Møller method (3.0º to 7.0º for 1.1 GeV; 1.6º to 7.0º for 2.2 GeV)
- PRad-II: two planes of GEM/μRwell allow for *integrated Møller method* for the entire experiment
- Event generators for unpolarized elastic ep and Møller scatterings have been developed based on complete calculations of radiative corrections – *PRad-II with NNL for RC*
  1. A. V. Gramolin et al., J. Phys. G Nucl. Part. Phys. 41(2014)115001
  2. I. Akushevich et al., Eur. Phys. J. A 51(2015)1 (beyond ultra relativistic approximation)
- A Geant4 simulation package is used to study the radiative effects, and an iterative procedure applied

$$\sigma_{ep}^{Born(exp)} = \left(\frac{\sigma_{ep}}{\sigma_{ee}}\right)^{exp} / \left(\frac{\sigma_{ep}}{\sigma_{ee}}\right)^{sim} \cdot \left(\frac{\sigma_{ep}}{\sigma_{ee}}\right)^{Born(model)} \cdot \sigma_{ee}^{Born(model)}$$

- bg run, gas in, cell in
- bg run, gas out, cell out
- bg run, gas out, cell in
- residual hydrogen gas contribution

PRad

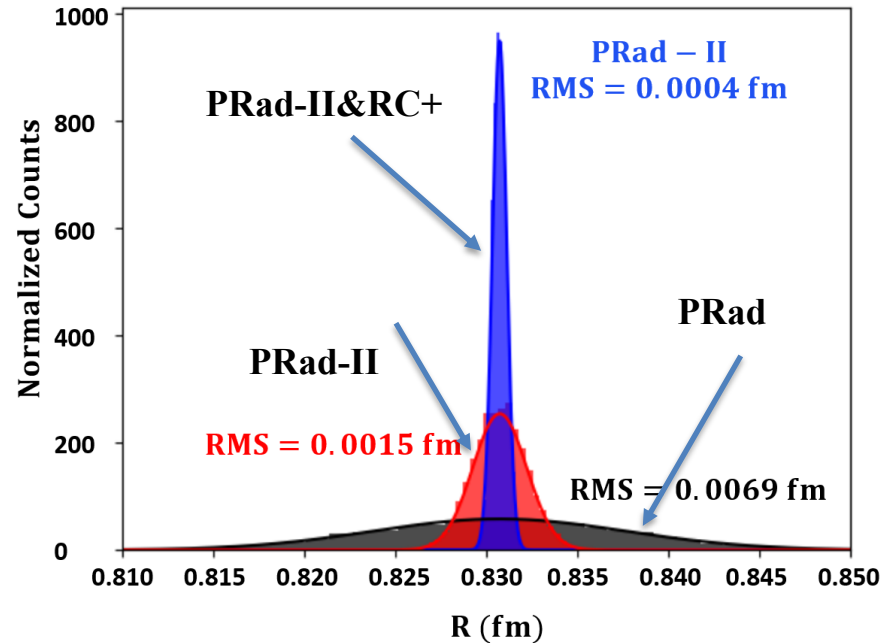

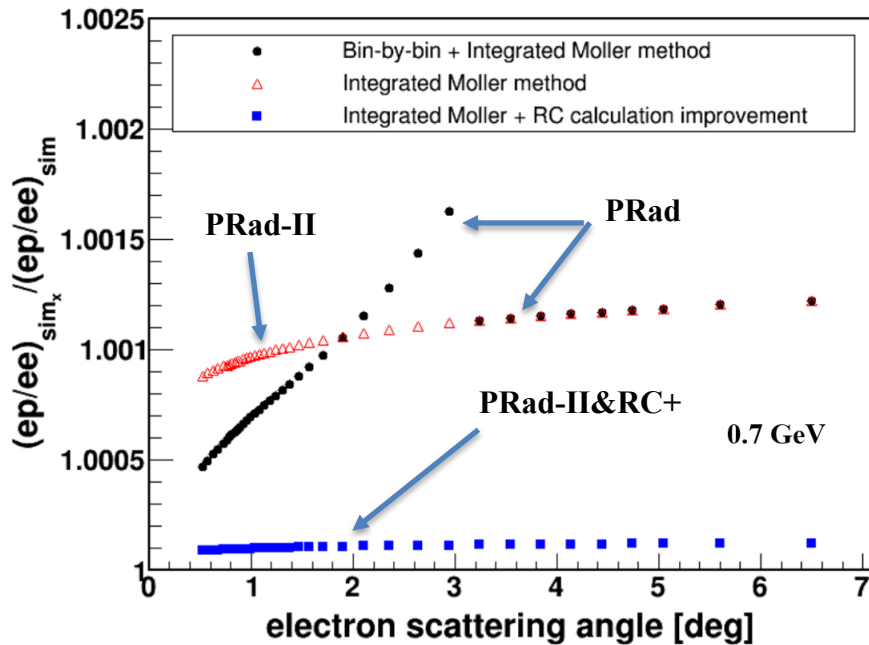

- Z from gem + gem
- Z from gem + hycal

PRad

PRad-II
Improvement: addition of a 2nd plane of GEMs/ µRWELL and RC calculations

- Improvement in GEM/µRwell efficiency determination allows for integrated Møller method
- Major improvement in radius determination associated with integrated Møller
- More improvement expected with the RC calculations at the NNL -- RC+

- **Bin-by-bin + Integrated Møller Method (PRad method):**
  - Bin-by-bin method is applied below 3.0 deg at 0.7, 1.4 GeV and 1.6 deg at 2.1 GeV
  - Integrated Møller method applied in the other angular bins

Improvements to HyCal

- **HyCal: inner 1156 PWO$_4$ modules with outer 576 lead glass modules originally funded by NSF-MRI for the PrimEX experiment (*Science* 6490, 506-509 (2020)**
- **Replacing all lead-glass by PbWO$_4$ leads to**
  - **Better uniformity, better position and energy resolutions**
  - **major improvement suppressing inelastic contamination – more important at higher Q^2**
- **Convert to FADC based readout allowing data taking rate increase by a factor of 7 compared to PRad**

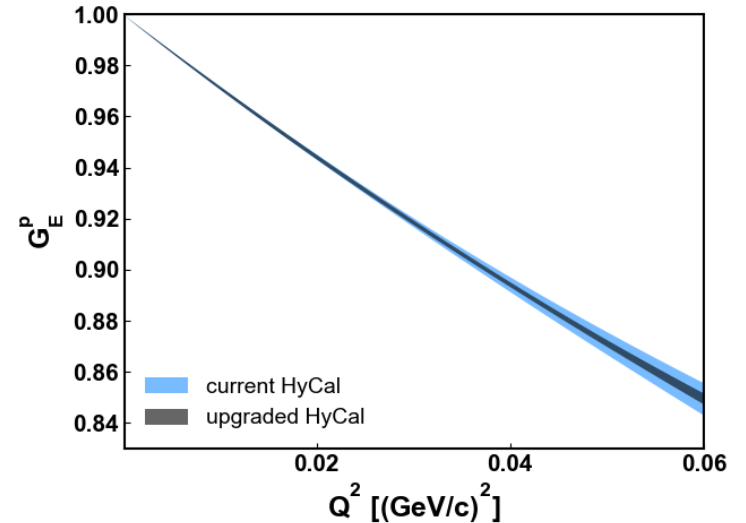

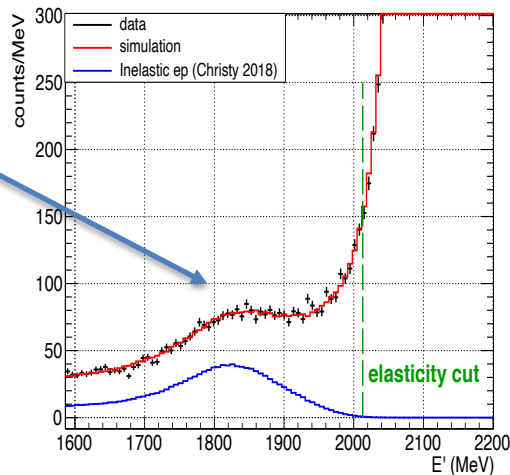

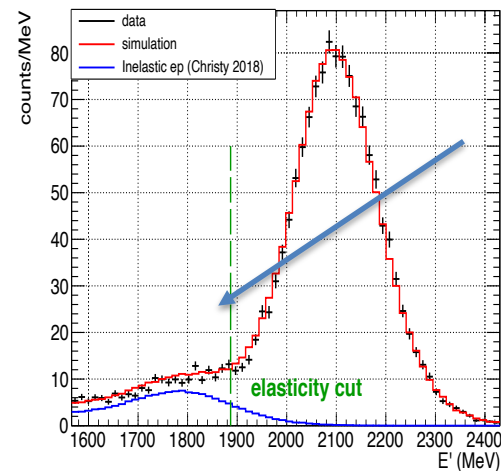

**PbWO$_4$ region**

Lead glass region

16

New rectangular cross shaped scintillator detectors
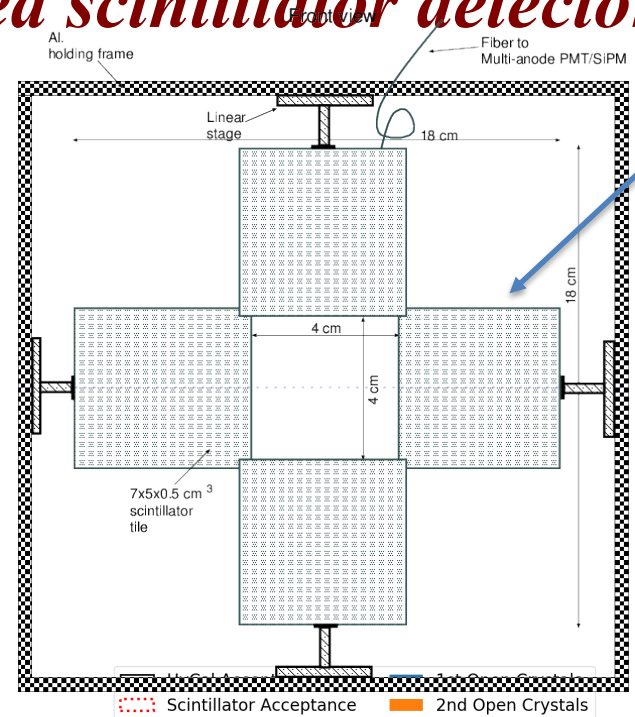

- Four 7x5x0.5 cm^3 tiles of plastic scintillators
- Arranged in a cross shape with a 4x4 cm^2 hole in the center
- Each tile is attached to a linear stage in x-y plane
- Each tile is read out using optical fibers and multi-anode PMTs or SiPMs

A factor of 3.8 improvement!

Projections for PRad-II

Differential Cross section
Electric form factor
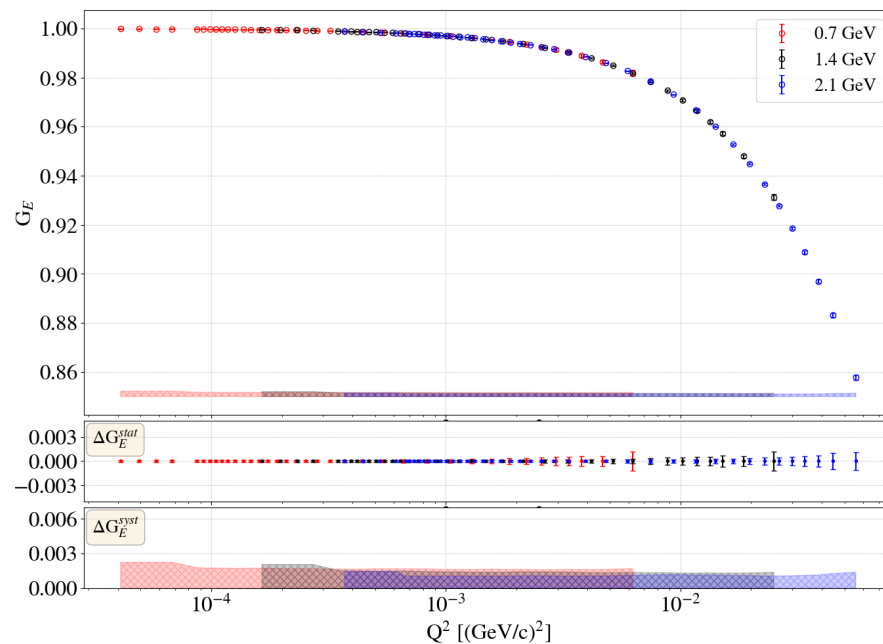

Summary and outlook

- The PRad experiment demonstrated the power of calorimetric method for the proton radius measurement, and reported high-impact result on r_p

- The PRad-II will push for the precision of such method and improve the r_p measurement by a factor **3.8!**

- High precision data from PRad-II on G_E^p will help resolve the differences between PRad and modern ep experiments including A1@Mainz

- High precision result on r_p from PRad-II will allow for systematic study between results from ep and muonic hydrogen measurements

- PRad-II may open a new window of opportunities for precision electromagnetic physics
