Discovery of point-like particles inside proton

Motivations

Understanding the **emergent phenomena** of QCD

*“In philosophy, systems theory, science, and art, emergence occurs when an **entity is observed** to have properties **its parts** do not have on their own, properties or behaviors which emerge only when the parts interact in a wider whole.” Wiki*

Hadron Structure

Hadron formation

What do we mean by “**hadron structure**” ? (1D)

$$\xi = \frac{k^+}{P^+}$$

Parton momentum fraction relative to **parent hadron**

$$f_i(\xi) = \int \frac{dw^-}{4\pi} e^{-i\xi p^+ w^-} \langle N | \bar{\psi}_i(0, w^-, \mathbf{0}_T) \gamma^+ \psi_i(0) | N \rangle$$

**parton distribution
function (PDF)**

Interpretation in non-interacting QCD

$$\psi_i(x) = \sum_{k,\alpha} b_{k,\alpha}(x^+) u_{k,\alpha} e^{-ik^+ x^- + ik_T \cdot x_T} + d_{k,\alpha}^\dagger(x^+) u_{k,-\alpha} e^{ik^+ x^- - ik_T \cdot x_T}$$

$$f_i(\xi) \sim \sum_{\alpha} \int d^2 k_T \langle N | \underbrace{b_{k,\alpha}^\dagger b_{k,\alpha}}_{\text{number operator}}(\xi p^+, k_T, \alpha) | N \rangle$$

How quarks and gluons are distributed?

What do we mean by “**hadronization**” ? (1D)

$$\zeta = \frac{p_h^+}{k^+}$$

hadron momentum fraction relative to **parent parton**

$$d_{h/j}(\zeta) = \frac{\text{Tr}_{\text{color, Dirac}}}{4N_{c,j}} \sum_X \zeta \int \frac{dw^+}{2\pi} e^{i(p_h^-/\zeta)w^+} \\ \times \gamma^- \langle 0 | \bar{\psi}_j(0, w^+, \mathbf{0}_T) | p_h, X \rangle \langle p_h, X | \psi_j(0) | 0 \rangle$$

**Fragmentation
functions (FFs)**

X = all states except detected hadron **h**

How quarks and gluons are distributed?

Hadron structure in **interacting** theory

Definition of PDFs in field theory requires renormalization

PDFs will depend on renormalization scale and its RGEs are the famous DGLAP equations

UV singularity when the field separation is zero

$$f_i(\xi) \stackrel{!}{=} \int \frac{dw^-}{4\pi} e^{-i\xi p^+ w^-} \langle N | \bar{\psi}_i(0, w^-, \mathbf{0}_T) \gamma^+ \psi_i(0) | N \rangle$$

Renormalization

$$f = Z_F \otimes f_{\text{bare}}$$
$$f(\xi) \rightarrow f(\xi, \mu)$$

Dokshitzer–**G**ribov–**L**ipatov–**A**ltarelli–**P**arisi

$$\frac{df_i(\xi, \mu^2)}{d \ln \mu^2} = \sum_j \int_{\xi}^1 \frac{dy}{y} P_{ij}(\xi, \mu^2) f_j\left(\frac{y}{\xi}, \mu^2\right)$$

aka **DGLAP**

Spin structures

$$f = f_{\rightarrow} + f_{\leftarrow}$$

$$\langle N | \bar{\psi}_i(0, w^-, \mathbf{0}_T) \gamma^+ \psi_i(0) | N \rangle$$

$$\Delta f = f_{\rightarrow} - f_{\leftarrow}$$

Helicity distribution

$$\langle N | \bar{\psi}_i(0, w^-, \mathbf{0}_T) \gamma^+ \gamma_5 \psi_i(0) | N \rangle$$

$$\delta_T f = f_{\uparrow} - f_{\downarrow}$$

Transversity

$$\langle N | \bar{\psi}_i(0, w^-, \mathbf{0}_T) \gamma^+ \gamma_{\perp} \gamma_5 \psi_i(0) | N \rangle$$

Extensions to 3D

$$\xi = \frac{k^+}{P^+}$$

Longitudinal momentum fraction

$$f(\xi)$$

PDFs

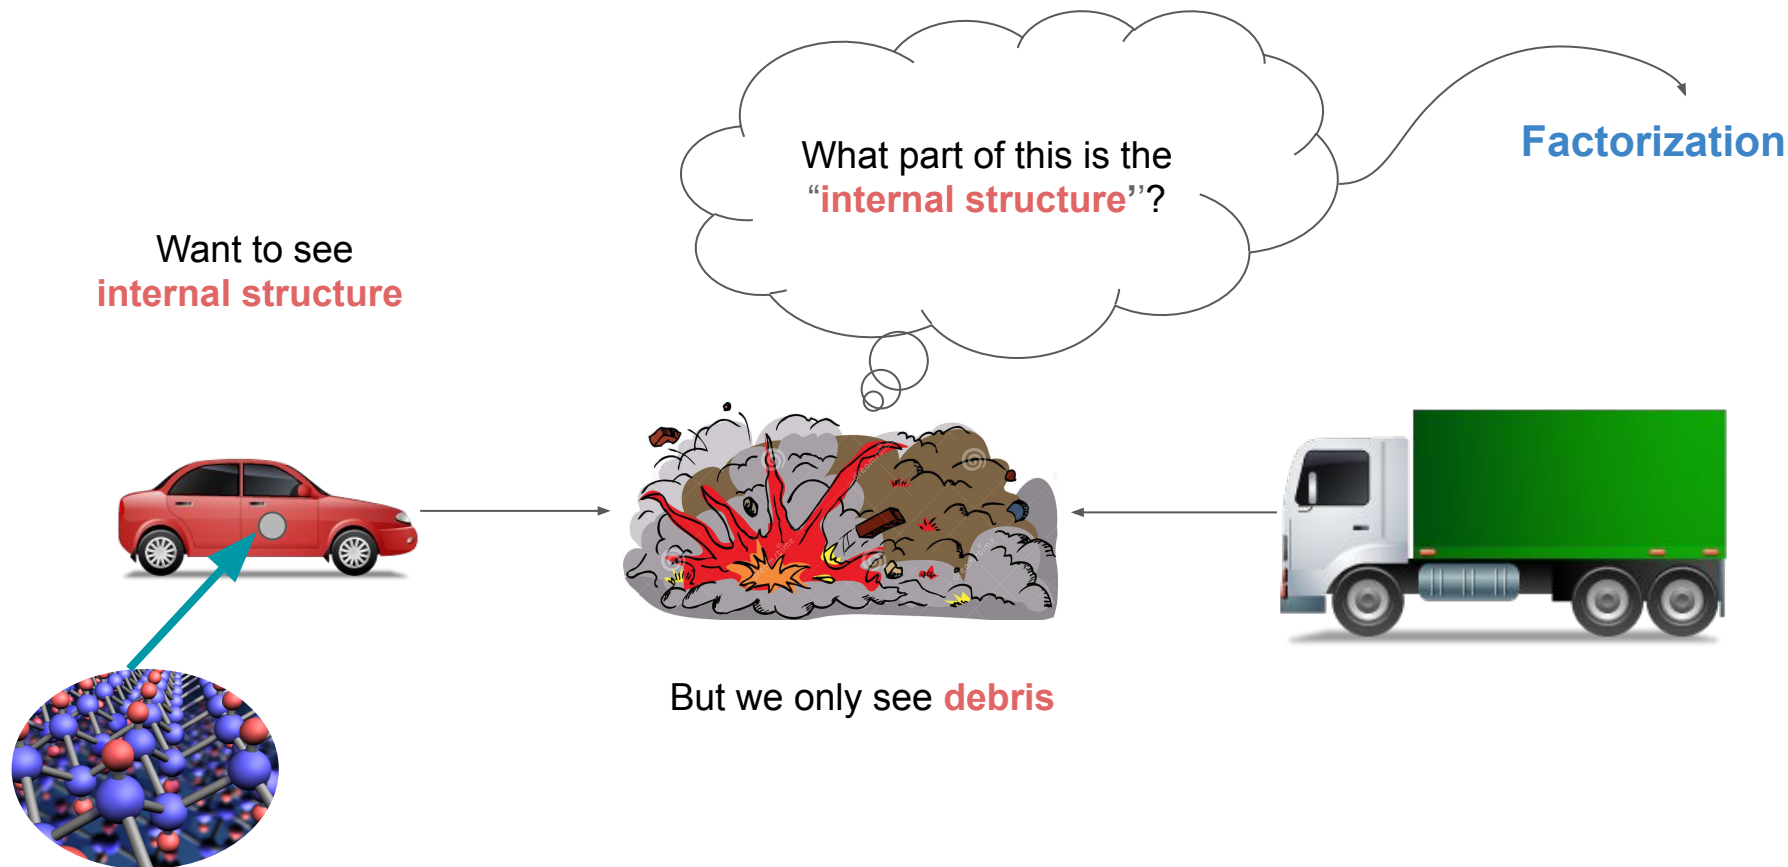

$$f(\xi, k_T)$$

Transverse momentum
distribution -> **TMDs**

$$f(\xi, b_T)$$

Impact parameter
distribution -> **GPDs**

So how do we get **hadron structure** from experimental data?

Factorization in deep-inelastic scattering (DIS)

Factorization in other reactions

SIA

$$d\sigma = \sum_i H_i^{\text{SIA}} \otimes d_i$$

SIDIS

$$d\sigma = \sum_{ij} H_{ij}^{\text{SIDIS}} \otimes f_i \otimes d_j$$

..and many more

Universality

cross sections described by **universal**
non-perturbative functions, e.g. PDFs, FFs

The Bayesian inference

Experiments = theory + errors

RGE boundary conditions

$$f_i(\xi, \mu_0^2) = N_i \xi^{a_i} (1 - \xi)^{b_i} (1 + \dots)$$

$$d_i(\zeta, \mu_0^2) = N_i \zeta^{a_i} (1 - \zeta)^{b_i} (1 + \dots)$$

$$\mathbf{a} = (N_i, a_i, b_i, \dots)$$

Posterior
distribution

Prior
distribution

$$\rho(\mathbf{a}|\text{data}) \sim \mathcal{L}(\mathbf{a}, \text{data}) \pi(\mathbf{a})$$

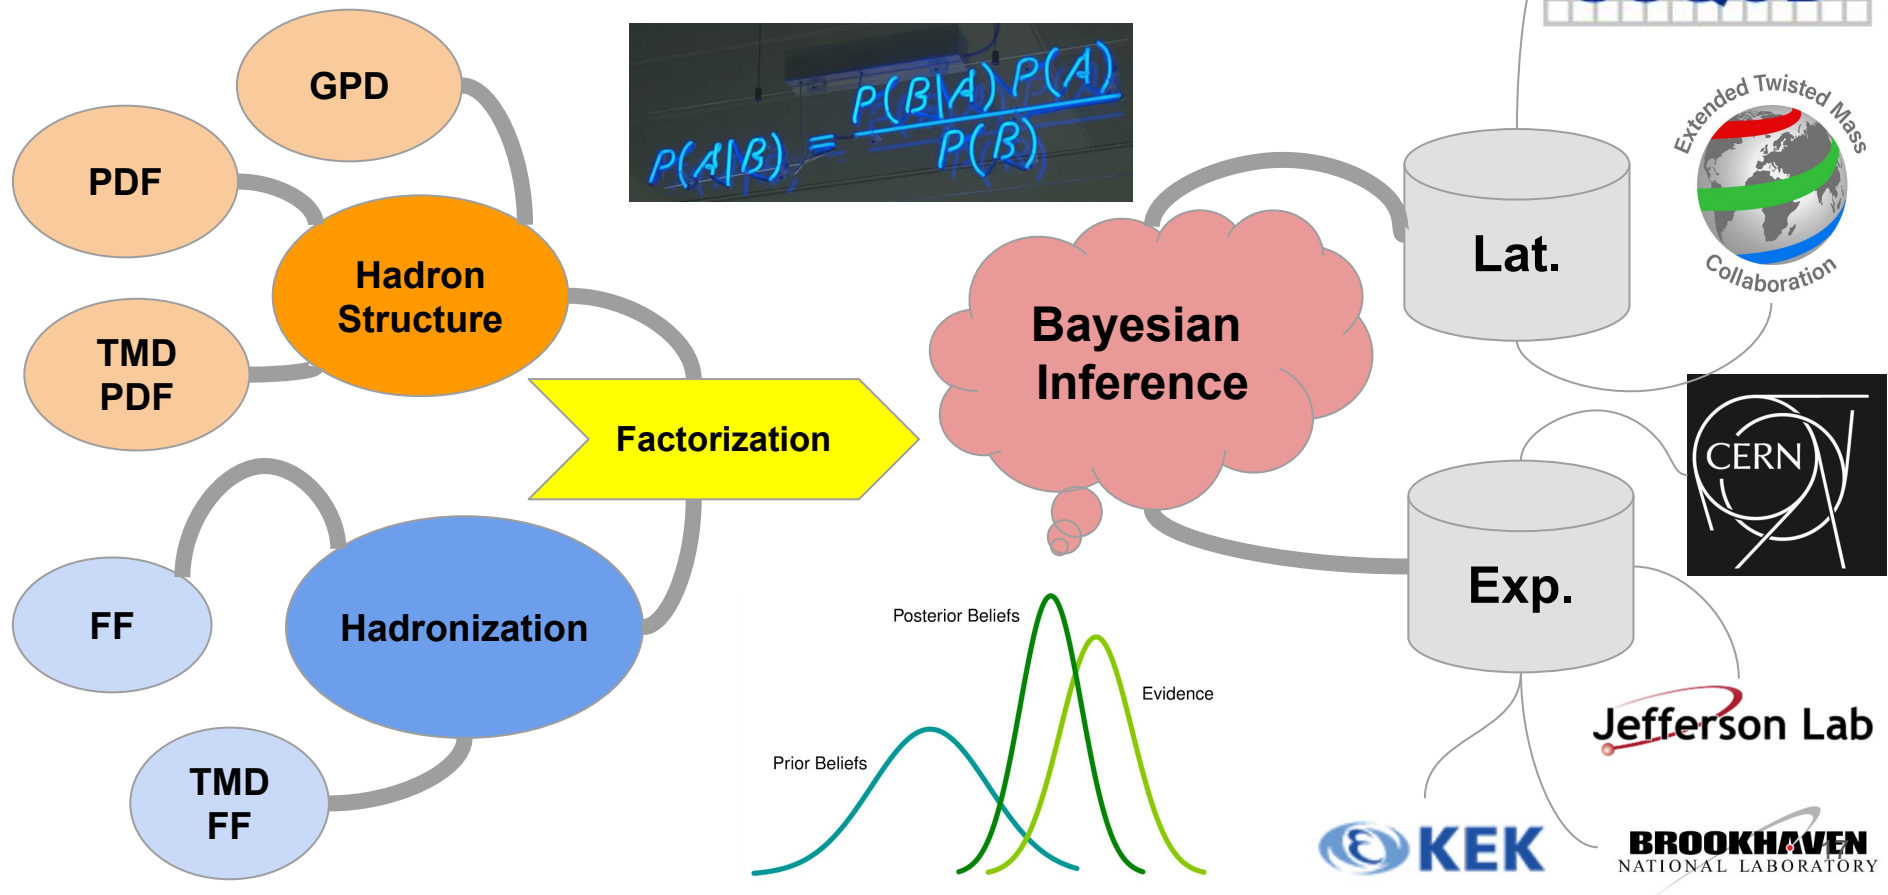

Likelihood

$$\mathcal{L}(\mathbf{a}, \text{data}) = \exp \left[-\frac{1}{2} \chi^2(\mathbf{a}, \text{data}) \right]$$

$$\mathbb{E}[f_i(\xi, \mu^2)] = \int d^n \mathbf{a} \rho(\mathbf{a}|\text{data}) f_i(\xi, \mu^2; \mathbf{a})$$

$$\mathbb{V}[f_i(\xi, \mu^2)] = \int d^n \mathbf{a} \rho(\mathbf{a}|\text{data}) [f_i(\xi, \mu^2; \mathbf{a}) - \mathbb{E}[f_i(\xi, \mu^2)]]^2$$

The QCD global analysis paradigm

$$R_s = \frac{s + \bar{s}}{\bar{u} + \bar{d}}$$

The simultaneous fit of PDFs and FFs provides new insights on nucleon strangeness

QCD carpentry in python

- We will use a jupyter-notebook available at <https://github.com/QCDHUB/qcdcarpentry>
- The lectures involves several exercises. I will give few minutes to work on them
- You need to have jupyter notebook available in your computer. All the required dependencies are listed. Use **\$pip install xyz** to get libraries you don't have.
- Ok, let's take a look the notebook

Continue to
Jupyter notebook

```

Exercise 1 (time: 5 mins)

- plot α_{EM} as a function of $\mu^2 \in (m_e^2, 10^4)$
- include vertical lines indicating the mass thresholds m_e^2 , m_μ^2 , m_τ^2

Solving QCD's beta function

The running of the strong coupling

We need a boundary condition to solve the RGE

$$a_S(\mu^2) = \frac{\alpha_S(\mu^2)}{4\pi}$$

$$\frac{da_S}{d\ln\mu^2} = \beta(a_S) = -(\beta_0 a_S^2 + \beta_1 a_S^3 + \dots)$$

$$\beta_0 = 11 - \frac{2}{3}N_f \quad \beta_1 = 102 - \frac{38}{3}N_f$$

The beta function is discontinuous

Solving the QCD beta function

scale	N_f	active flavors
$\mu < m_c$	3	u, d, s
$m_c \leq \mu < m_b$	4	u, d, s, c
$m_b \leq \mu$	5	u, d, s, c, b

$$\frac{da_s}{d \ln \mu^2} = \beta(a_s) = -(\beta_0 a_s^2 + \beta_1 a_s^3 + \dots)$$

To solve the RGE at any scale we need boundary conditions for 3,4,5 flavors

Continue to
Jupyter notebook

Exercise 2.A (time: 5 mins)

- plot α_S as a function of $\mu^2 \in (1, 10^4)$
- make the plot using 1-loop and 2-loops
- include vertical lines indicating the mass thresholds m_c^2 , m_b^2 and m_Z^2

Exercise 2.B (time: 5 mins)

- plot $\beta(\mu^2)$ as a function of $\mu^2 \in (1, 10^4)$
- using 2-loops (order=1)
- include vertical lines indicating the mass thresholds m_c^2 , m_b^2 and m_Z^2
- Hint:
 - for a given μ^2 , compute a via `get_a` and N_f via `get_Nf`
 - use the function `beta_func(a, Nf)` to get the numerical value of the beta function

Outline

$$N(z) = [c + z \cos(\phi)] + i[z \sin(\phi)]$$

real

imaginary

Mellin transforms

Mellin transforms

Mellin transform of $f(x)$

$$F(N) = \int_0^1 dx x^{N-1} f(x)$$

Can be done numerically

$$f(x) = \frac{1}{2\pi i} \int_c dN x^{-N} F(N)$$

Inverse Mellin transform

Complex contour integration

Numerical implementation

$$f(x) = \frac{1}{2\pi i} \int_c dN x^{-N} F(N)$$

$$N(z) = c + ze^{i\phi}$$

$$f(x) = \frac{1}{\pi} \int_0^\infty dz \operatorname{Im} \left[e^{i\phi} x^{-N(z)} F(N(z)) \right]$$

Example

$$f(x) = x$$

$$F(N) = \int_0^1 dx x^{N-1} f(x)$$

$$F(N) = \frac{1}{N+1} x^{N+1} \Big|_0^1 = \frac{1}{N+1}$$

$$x = \frac{1}{\pi} \int_0^\infty dz \operatorname{Im} \left[e^{i\phi} x^{-N(z)} \frac{1}{N(z) + 1} \right]$$

Pole at $N = -1$

C is chosen so that all the poles are in the left of C

ϕ is chosen to be greater than $\pi/2$

$$N(z) = [\text{real}] + i[\text{imaginary}]$$

Right most Pole of $F(N)$

Gaussian Quadrature

$$\int_{-1}^1 dx \, g(x) \approx \sum_{i=1}^n w_i g(x_i)$$

Only for range -1 to 1

For arbitrary range

$$\int_a^b dz \, g(z) \approx \frac{b-a}{2} \sum_{i=1}^n w_i \, g\left(\frac{1}{2}(b-a)x_i + \frac{1}{2}(a+b)\right)$$

Inverse mellin transform with Gaussian Quadrature

$$f(x) = \frac{1}{\pi} \int_0^\infty dz \operatorname{Im} \left[e^{i\phi} x^{-N(z)} F(N(z)) \right]$$

$$f(x) \approx \frac{1}{\pi} \sum_{j=1}^k \frac{1}{2} (z_{\max}^j - z_{\min}^j) \sum_i w_i \operatorname{Im} \left[e^{i\phi} x^{-N(z_i^j)} F(N(z_i^j)) \right]$$

We only need to know F at the segment gaussian points

Mellin convolutions

Definition of a convolution of two functions

$$\sigma(z) = \int_z^1 \frac{d\xi}{\xi} h(\xi) f\left(\frac{z}{\xi}\right) \quad \Rightarrow \quad \Sigma(N) = \int_0^1 dz \, z^{N-1} \sigma(z)$$

$$\Sigma(N) = H(N) F(N) \quad \bullet \quad \bullet \quad \bullet$$

$$H(N) = \int_0^1 dy \, y^{N-1} h(y)$$

$$F(N) = \int_0^1 dy \, y^{N-1} f(y)$$

Mellin transform
makes a convolution
an ordinary product

Why **Mellin** transforms?

PDFs obeys a system of integro differential equations (DGLAP)

The kernels are known analytically. They are called “splitting functions”

Continue to
Jupyter notebook

This is a “mellin convolution”

$$\frac{\partial}{\partial \ln \mu^2} f_{j/H}(\xi, \mu) = \sum_{j'} \int_{\xi}^1 \frac{dz}{z} P_{jj'}(z, g) f_{j'/H}(\xi/z, \mu)$$

This is a matrix equation

$$\frac{\partial}{\partial \ln \mu^2} F_{j/H}(N, \mu) = \sum_{j'} P_{jj'}(N, \mu) F_{j'/H}(N, \mu)$$

Exercise 3.A (time: 5 mins)

- Lets try $f(x) = x^a(1-x)^b$ with $a = -0.5$ and $b = 3$.
- Plot $xf(x)$ vs. x and the inverse mellin transform for $0 < x < 1$ (use log scale for the x axis)
- **Hint:** the mellin transform of f is $F(N) = \Gamma(N+a)\Gamma(b+1)/\Gamma(N+a+b+1)$
- **Hint:** Gamma function is available via `gamma(...)`
- **Attention:** the pole of F is at $N = -a$. Choose $c > -a$

Exercise 3.B (time: 10 mins)

Consider the convolution

$$\sigma(z) = \int_z^1 \frac{dx}{x} f(x) g\left(\frac{z}{x}\right)$$

The mellin transform is

$$\Sigma(N) = F(N)G(N)$$

with

$$F(N) = \int_0^1 x^{N-1} f(x)$$

$$G(N) = \int_0^1 x^{N-1} g(x)$$

Using

$$f(x) = x^a(1-x)^b \text{ with } a = -0.5 \text{ and } b = 3.$$

$$g(x) = x^c(1-x)^d \text{ with } c = 1.0 \text{ and } d = 3$$

- Plot: $z\sigma(z)$ vs. z
- Plot: $z\mathcal{M}^{-1}(\Sigma)$ vs. z
- use $0 < z < 1$

$$\frac{\partial}{\partial \ln \mu^2} f_{j/H}(\xi, \mu) = \sum_{j'} \int_{\xi}^1 \frac{dz}{z} P_{jj'}(z, g) f_{j'/H}(\xi/z, \mu)$$

Solving **DGLAP**

DGLAP in Mellin space

Splitting kernels

$$\frac{\partial}{\partial \ln \mu^2} f_{j/H}(\xi, \mu) = \sum_{j'} \int_{\xi}^1 \frac{dz}{z} P_{jj'}(z, g) f_{j'/H}(\xi/z, \mu)$$

System of
integro-differential
equations

$$\frac{\partial}{\partial \ln \mu^2} F_{j/H}(N, \mu) = \sum_{j'} P_{jj'}(N, \mu) F_{j'/H}(N, \mu)$$

Ordinary system of
differential equations

Can be solved
Analytically!

Flavor composition

$$\frac{\partial}{\partial \ln \mu^2} F_{j/H}(N, \mu) = \sum_{j'} P_{jj'}(N, \mu) F_{j'/H}(N, \mu)$$

11 equations for 5
active quark
flavors + glue

$$F_{j/H}(N) = F_j$$

$$F_{q^\pm} = F_q \pm F_{\bar{q}}$$

$$F_{\pm 3} = F_{u^\pm} - F_{d^\pm},$$

$$F_{\pm 8} = F_{u^\pm} + F_{d^\pm} - 2F_{s^\pm},$$

$$F_{\pm 15} = F_{u^\pm} + F_{d^\pm} + F_{s^\pm} - 3F_{c^\pm},$$

$$F_{\pm 24} = F_{u^\pm} + F_{d^\pm} + F_{s^\pm} + F_{c^\pm} - 4F_{b^\pm},$$

$$F_{\pm} = F_{u^\pm} + F_{d^\pm} + F_{s^\pm} + F_{c^\pm} + F_{b^\pm}$$

$$F_{j/H}(N) \longrightarrow \boxed{F_{\pm j}} \quad \boxed{F_{\pm}} \quad \boxed{F_g} \dots$$

Just linear
transformations

$$11 = 8 + 2 + 1$$

Flavor **singlet** and **non-singlet** evolution

$$\frac{\partial}{\partial \ln \mu^2} F_{j/H}(N, \mu) = \sum_{j'} P_{jj'}(N, \mu) F_{j'/H}(N, \mu)$$

Non singlet combinations decouples from glue

$$\frac{\partial F_{\pm j}}{\partial \ln \mu^2} = P_{\text{NS}}^{\pm} F_{\pm j}$$

$$\frac{\partial F_{-}}{\partial \ln \mu^2} = P_{\text{NS}}^{-} F_{-}$$

Non-singlet evolution

$$\frac{\partial}{\partial \ln \mu^2} \begin{pmatrix} F_{+} \\ F_g \end{pmatrix} = \begin{pmatrix} P_{qq} & P_{qg} \\ P_{gq} & P_{gg} \end{pmatrix} \begin{pmatrix} F_{+} \\ F_g \end{pmatrix}$$

Singlet evolution

Solving the **non-singlet** evolution equations

$$\frac{\partial F_{\pm j}}{\partial \ln \mu^2} = P_{\text{NS}}^{\pm} F_{\pm j}$$

$$P_{ij}(a_S) = \sum_{m=0}^{\infty} a_S^{m+1}(\mu) P_{ij}^{(m)}$$

Splitting functions
depend only on
alphaS

$$\frac{da_S}{d \ln \mu^2} = \beta(a_S)$$

$$\frac{\partial F_{\pm j}}{\partial a_S} = -\frac{1}{\beta_0 a_S} P_{\text{NS}}^{\pm(0)} F_{\pm j}$$

$$F_{\pm j}(a_S) = \left(\frac{a_S}{a_0} \right)^{-P_{\text{NS}}^{\pm(0)} / \beta_0} F_{\pm j}(a_0)$$

alphaS at the final
scale

alphaS at the input
scale

Solving the **singlet** evolution equations

Eigenvalue
decomposition

$$\frac{\partial}{\partial \ln \mu^2} \begin{pmatrix} F_+ \\ F_g \end{pmatrix} = \begin{pmatrix} P_{qq} & P_{qg} \\ P_{gq} & P_{gg} \end{pmatrix} \begin{pmatrix} F_+ \\ F_g \end{pmatrix}$$

$$\frac{\partial}{\partial a_S} \begin{pmatrix} F_+ \\ F_g \end{pmatrix} = \frac{-1}{\beta_0 a_S} \begin{pmatrix} P_{qq}^{(0)} & P_{qg}^{(0)} \\ P_{gq}^{(0)} & P_{gg}^{(0)} \end{pmatrix} \begin{pmatrix} F_+ \\ F_g \end{pmatrix}$$

$$\mathbf{R}_0 = \frac{1}{\beta_0} \begin{pmatrix} P_{qq}^{(0)} & P_{qg}^{(0)} \\ P_{gq}^{(0)} & P_{gg}^{(0)} \end{pmatrix} = r_- \mathbf{e}_- + r_+ \mathbf{e}_+$$

$$\mathbf{e}_{\pm} = \frac{1}{r_{\pm} - r_{\mp}} [\mathbf{R}_0 - r_{\mp} \mathbf{I}]$$

$$r_{\pm} = \frac{1}{2\beta_0} \left[P_{qq}^{(0)} + P_{gg}^{(0)} \pm \sqrt{\left(P_{qq}^{(0)} - P_{gg}^{(0)} \right)^2 + 4P_{qg}^{(0)} P_{gq}^{(0)}} \right]$$

$$\begin{pmatrix} F_+(a_S) \\ F_g(a_S) \end{pmatrix} = \left[\mathbf{e}_- \left(\frac{a_S}{a_0} \right)^{-r_-} + \mathbf{e}_+ \left(\frac{a_S}{a_0} \right)^{-r_+} \right] \begin{pmatrix} F_+(a_0) \\ F_g(a_0) \end{pmatrix}$$

Flavor decomposition

$$\boxed{F_{\pm j}} \quad \boxed{F_{\pm}} \quad \boxed{F_g}$$

$$F_{b^{\pm}} = (F_{-} - F_{\pm 24})/5$$

$$F_{c^{\pm}} = F_{b^{\pm}} + (F_{\pm 24} - F_{\pm 15})/4$$

$$F_{s^{\pm}} = F_{c^{\pm}} + (F_{\pm 15} - F_{\pm 8})/3$$

$$F_{d^{\pm}} = F_{s^{\pm}} + (F_{\pm 8} - F_{\pm 3})/2$$

$$F_{u^{\pm}} = F_{s^{\pm}} + (F_{\pm 8} + F_{\pm 3})/2$$

$$F_q = \frac{1}{2}(F_{q^+} + F_{q^-})$$

$$F_{\bar{q}} = \frac{1}{2}(F_{q^+} - F_{q^-})$$

Evolution flow

$$F_{\pm j}$$

$$F_{\pm}$$

$$F_g$$

$$F_{b^\pm} = (F_- - F_{\pm 24})/5$$

$$F_{c^\pm} = F_{b^\pm} + (F_{\pm 24} - F_{\pm 15})/4$$

$$F_{s^\pm} = F_{c^\pm} + (F_{\pm 15} - F_{\pm 8})/3$$

$$F_{d^\pm} = F_{s^\pm} + (F_{\pm 8} - F_{\pm 3})/2$$

$$F_{u^\pm} = F_{s^\pm} + (F_{\pm 8} + F_{\pm 3})/2$$

Evolved PDFs

$$F_{j/H}(N)$$

Input scale PDFs

$$F_{j/H}(N)$$

$$F_{\pm j}$$

$$F_{\pm}$$

$$F_g$$

$$F_{\pm 3} = F_{u^\pm} - F_{d^\pm},$$

$$F_{\pm 8} = F_{u^\pm} + F_{d^\pm} - 2F_{s^\pm},$$

$$F_{\pm 15} = F_{u^\pm} + F_{d^\pm} + F_{s^\pm} - 3F_{c^\pm},$$

$$F_{\pm 24} = F_{u^\pm} + F_{d^\pm} + F_{s^\pm} + F_{c^\pm} - 4F_{b^\pm},$$

$$F_{\pm} = F_{u^\pm} + F_{d^\pm} + F_{s^\pm} + F_{c^\pm} + F_{b^\pm}$$

Boundary conditions

We need boundary conditions at each mass threshold

$$u_v, d_v, \bar{u}_0, \bar{d}_0, s_0, \bar{s}_0, S_1, S_2$$

Exercise 5.A (time: 5 mins)

- Physical proton pdfs will need $\int_0^1 dx u_v(x) = 2$ and $\int_0^1 dx d_v(x) = 1$
- Modify the `BC` we use above and show that the valence number sum rules don't evolve
- hint:**
 - Use the function `dglap.evolve(BC,Q2ini,Q2fin,Nf)` to evolve
 - Set `N=1` in the mellin class via `conf['mellin'].N=np.array([1])`
 - Set `um = np.array([2])`
 - Set `dm = np.array([1])`
 - Print the output values `um` and `dm`

```
Nf=4
Q2ini=conf['aux'].mc2
Q2fin=conf['aux'].mb2
output = dglap.evolve(BC,Q2ini,Q2fin,Nf)
print('um=',output['um'])
print('dm=',output['dm'])

um= [2.+0.j]
dm= [1.+0.j]
```

Exercise 5.B (time: 5 mins)

- A physical proton pdfs will need $\int_0^1 dx x [\Sigma(x) + g(x)] = 1$
- Modify the `BC` we use above and show that the momentum sum rules don't evolve
- **hint:**
 - Set `N=2` in the mellin class via `conf['mellin'].N=np.array([2])`
 - Set `g= 1-up-dp-sp`
 - Print the values of `output['g']+output['sigma']`

```
Nf=4
Q2ini=conf['aux'].mc2
Q2fin=conf['aux'].mb2
output = dglap.evolve(BC,Q2ini,Q2fin,Nf)
print('sigma+g (mu) =',output['g']+output['sigma'])

sigma+g (mu) = [0.99999997+0.j]
```

Exercise 6 (time: 5 mins)

- Check the valence number and momentum sum rules at $\mu^2 = m_c^2, 10, 100, 1000$

```
mu^2=1.638400

Outline

Lecture 1

- Motivations
- QCD carpentry setup
- Solving QCD's beta function

Lecture 2

- Mellin transforms
- Solving DGLAP
- Modeling input scale PDFs

Lecture 3

- DIS theory
- World DIS data
- The χ^2 function
- Global analysis

Lecture 4

- Bayesian inference
 - Maximum likelihood
 - MC methods
- JAM history
- Machine learning

DIS theory

Factorization in deep-inelastic scattering (DIS)

DIS kinematics

$$q = (l - l') \quad y = \frac{P \cdot q}{P \cdot l}$$
$$Q^2 = -q^2 \quad x_{\text{bj}} = \frac{Q^2}{2P \cdot q}$$

Think them as change
of variables

$$l'(E', \theta', \phi') = l'(x_{\text{bj}}, Q^2, \phi')$$

DIS factorization

$$\frac{d^2\sigma^i}{dx dy} = \frac{2\pi\alpha^2}{xyQ^2} \left((Y_+ + 2x^2y^2\frac{M^2}{Q^2}) \boxed{F_2^i} - y^2 \boxed{F_L^i} \mp Y_- x \boxed{F_3^i} \right)$$

$$F_i^p(x_{bj}, Q^2) = \sum_q e_q^2 \int_{x_{bj}}^1 \frac{d\xi}{\xi} \left[f_{q/p}(\xi, \mu^2) C_{q,i} \left(\frac{x_{bj}}{\xi}, \frac{Q^2}{\mu^2}, \alpha_S(\mu^2) \right) + f_{g/p}(\xi, \mu^2) C_{g,i} \left(\frac{x_{bj}}{\xi}, \frac{Q^2}{\mu^2}, \alpha_S(\mu^2) \right) \right]$$

Quark contributions

Gluon contributions

DIS in Mellin space

$$F_i^p(x_{\text{bj}}, Q^2) = \sum_q e_q^2 \int_{x_{\text{bj}}}^1 \frac{d\xi}{\xi} f_{q/p}(\xi, \mu^2) C_{q,i} \left(\frac{x_{\text{bj}}}{\xi}, \frac{Q^2}{\mu^2}, \alpha_S(\mu^2) \right) + (q \rightarrow g)$$

$$F_i^p(N, Q^2) = \sum_q e_q^2 f_{q/p}(N, \mu^2) C_{q,i} \left(N, \frac{Q^2}{\mu^2}, \alpha_S(\mu^2) \right) + (q \rightarrow g)$$

$$C_j(N) = C_j^{[0]}(N) + \frac{\alpha_S}{4\pi} C_j^{[1]}(N) + O(\alpha_S^2)$$

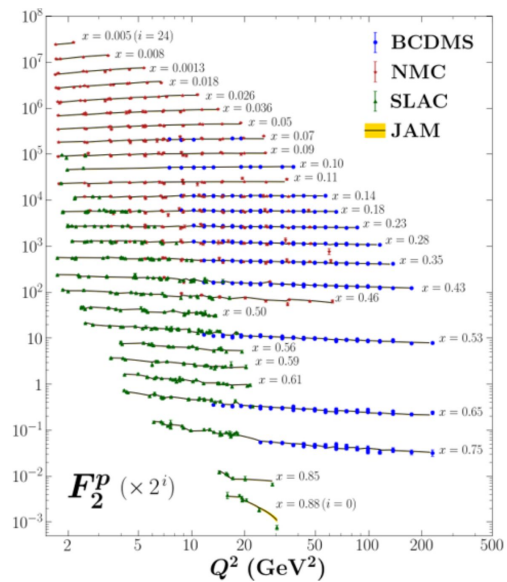

DIS with Deuteron target

$$F_i^d \approx \frac{1}{2} (F_i^p + F_i^n)$$

- This approximation ignores the “EMC” effect.
- If we ignore the large x_{bj} data, the approximation is ok

Accardi, Brady, Melnitchouk,
Owens, NS

            if any([c=='W2' for c in cols]):
                tab['X']=pd.Series(tab['Q2']/(tab['W2']-self.aux.M2+1))
            elif any([c=='W' for c in cols]):
                tab['X']=pd.Series(tab['Q2']/(tab['W']*2-self.aux.M2+1))
            else:
                print('cannot retrieve X values')
```

This class will load the excel files,
add missing kinematic variables
and transform the data into numpy
arrays

Exercise 7 (time: 5 mins)

- plot the kinematics bins x_{bj} , Q^2 of the world DIS data sets
- **Hint:** use log scale for both axis

Exercise 8 (time: 5 mins)

- plot the values of $F_{2,p}^{\text{NC}}$ as a function of x_{bj} from all the data sets
- **Hint:** use the columns `X`, `value`, `alpha` from `loss.tabs`

The **Loss** function

Anatomy of **Chi2** function

Experimental data point

Point-by-point correlated systematic uncertainties

Theory with pdf parameters **a**

$$\chi^2(\mathbf{a}) = \sum_{i,e} \left(\frac{\underline{d_{i,e}} - \sum_k r_e^k \underline{\beta_{i,e}^k} - \underline{T_{i,e}(\mathbf{a})}/N_e}{\underline{\alpha_{i,e}}} \right)^2 + \sum_k (r_e^k)^2 + \left(\frac{1 - N_e}{\underline{\delta N_e}} \right)^2$$

Uncorrelated uncertainties added in quadrature

Overall normalization uncertainty

Anatomy of **Chi2** function

Nuisance fitting
parameter

Penalties for the
Nuisance
parameters

$$\chi^2(\mathbf{a}) = \sum_{i,e} \left(\frac{d_{i,e} - \sum_k \underline{r}_e^k \beta_{i,e}^k - T_{i,e}(\mathbf{a})/\underline{N}_e}{\alpha_{i,e}} \right)^2 + \sum_k (\underline{r}_e^k)^2 + \left(\frac{1 - \underline{N}_e}{\delta N_e} \right)^2$$

$$\frac{\partial \chi^2}{\partial r_e^k} = 0$$

$$\chi^2(\mathbf{a}) = \sum_{i,e} \left(\frac{d_{i,e} - T_{i,e}(\mathbf{a})/N_e}{\alpha_{i,e}} \right)^2 - \sum_{k,k'} B_{k,e} A_{kk',e}^{-1} B_{k',e}$$

$$B_e^k = \sum_i \frac{\beta_{i,e}^k (d_{i,e} - T_{i,e}/N_e)}{\alpha_i^2}$$

$$A_{kk',e} = \delta_{kk'} + \sum_i \frac{\beta_{i,e}^k \beta_{i,e}^{k'}}{\alpha_i^2}$$

Anatomy of **Chi2** function

$$\chi^2(\mathbf{a}) = \sum_{i,e} \left(\frac{d_{i,e} - \sum_k r_e^k \beta_{i,e}^k - T_{i,e}(\mathbf{a})/N_e}{\alpha_{i,e}} \right)^2 + \sum_k (r_e^k)^2 + \left(\frac{1 - N_e}{\delta N_e} \right)^2$$

$$T_{i,e}^{\text{eff.}}(\mathbf{a}) = \sum_k r_e^k \beta_{i,e}^k + T_{i,e}(\mathbf{a})/N_e$$

We allow additive and multiplicative distortions to the theory to match the data

Exercise 9 (time: 5 mins)

- Include the HERA datasets via `get_datasets(Q2cut=1.27**2, W2cut=10, ihera=True)`
- Print the length of `res`, `rres`, `nres` and interpret these numbers
- Print the summary via `residuals.gen_report`

                    self.pmin.append(pmin)
                    self.pmax.append(pmax)
                    if p<pmin or p>pmax:
                        if conf['check lims']: raise ValueError
```

Check the limits

Updates the PDF
class

Handle internally
parameter ordering

Exercise 10 (time: 5 mins)

- Use the method `gen_flat` to scan 100 random parameter vectors within the hyperbox and plot the resulting pdf combinations xu_v , xd_v , xg at the input scale $\mu^2 = 1.27 * 2$.
- Hint: use the x-range `X = 10**np.linspace(-2,np.log10(0.9),100)`

Loss function

Observables

Reset boundary
conditions

parametrization

$$\chi^2(\mathbf{a}) = \sum_{i,e} \left(\frac{d_{i,e} - \sum_k r_e^k \beta_{i,e}^k - T_{i,e}(\mathbf{a})/N_e}{\alpha_{i,e}} \right)^2 + \sum_k (r_e^k)^2 + \left(\frac{1 - N_e}{\delta N_e} \right)^2$$

$$F_i^p(x_{\text{bj}}, Q^2) = \sum_q e_q^2 \int_{x_{\text{bj}}}^1 \frac{d\xi}{\xi} f_{q/p}(\xi, \mu^2) C_{q,i} \left(\frac{x_{\text{bj}}}{\xi}, \frac{Q^2}{\mu^2}, \alpha_s(\mu^2) \right) + (q \rightarrow g)$$

$$\frac{\partial}{\partial \ln \mu^2} f_{j/H}(\xi, \mu) = \sum_{j'} \int_{\xi}^1 \frac{dz}{z} P_{jj'}(z, g) f_{j'/H}(\xi/z, \mu)$$

$$T(\xi; \mathbf{a}) = \mathcal{M} \frac{\xi^{\alpha} (1 - \xi)^{\beta} (1 + \gamma \sqrt{\xi} + \delta \xi)}{\int_0^1 d\xi \xi^{\alpha+1} (1 - \xi)^{\beta} (1 + \gamma \sqrt{\xi} + \delta \xi)}$$

Managing Residuals

RESMAN - interface to query residuals

In [75]: `class RESMAN:`

```
def __init__(self):
    conf['aux'] = AUX()
    conf['mellin'] = MELLIN(npts=4)
    conf['alphaS'] = ALPHAS()
    conf['ewweak'] = EWEAK()
    conf['pdf'] = PDF()

    self.parman=PARMAN()
    self.setup_idis()

def setup_idis(self):
    self.idis_tabs=READER().load_data_sets('idis')
    conf['idis_tabs'] = self.idis_tabs
    self.idis_thy=THEORY()
    conf['idis'] = self.idis_thy
    self.idis_res=RESIDUALS()

def get_residuals(self,par, initial = False):
    self.parman.set_new_params(par, initial = initial)

    data = conf['datasets']

    #--compute residuals
    res,rres,nres=[],[],[]
    if 'idis' in conf['datasets']:
        out=self.idis_res.get_residuals()
        res=np.append(res,out[0])
        rres=np.append(rres,out[1])
        nres=np.append(nres,out[2])

    return res,rres,nres
```

Loads all the parts that we need, including parman

Collect all the residuals

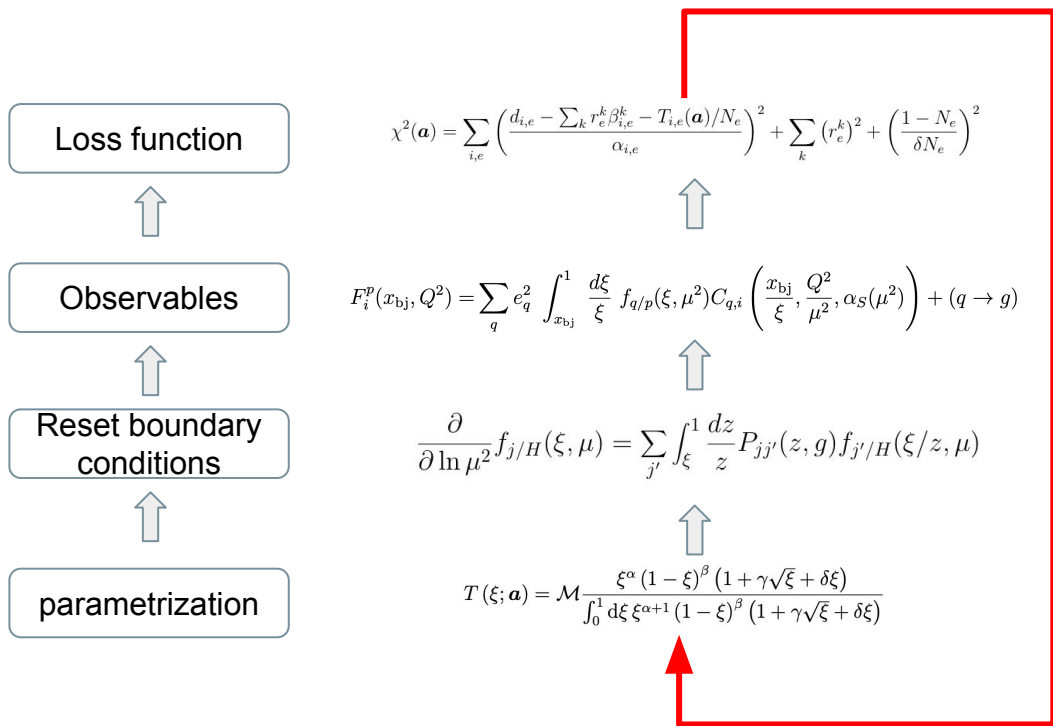

$$\chi^2(a) = \sum_{i,e} \left(\frac{d_{i,e} - \sum_k r_e^k \beta_{i,e}^k - T_{i,e}(a)/N_e}{\alpha_{i,e}} \right)^2 + \sum_k \left(r_e^k \right)^2 + \left(\frac{1 - N_e}{\delta N_e} \right)^2$$

Continue to
Jupyter notebook

Exercise 11 (time: 5 mins)

- Use `RESMAN` to compute 10 times the residuals for different parameters generated by `parman.gen_flat()`
- For each run print the first 3 entries of the current parameters as well as the total χ^2

SciPy.org Docs SciPy v1.6.0 Reference Guide Optimization and root finding (scipy.optimize)

scipy.optimize.least_squares¶

`scipy.optimize.least_squares(fun, x0, jac='2-point', bounds=(-inf, inf), method='trf', ftol=1e-08, xtol=1e-08, gtol=1e-08, x_scale=1.0, loss='linear', f_scale=1.0, diff_step=None, tr_solver=None, tr_options={}, jac_sparsity=None, max_nfev=None, verbose=0, args=(), kwargs=())` [\[source\]](#)

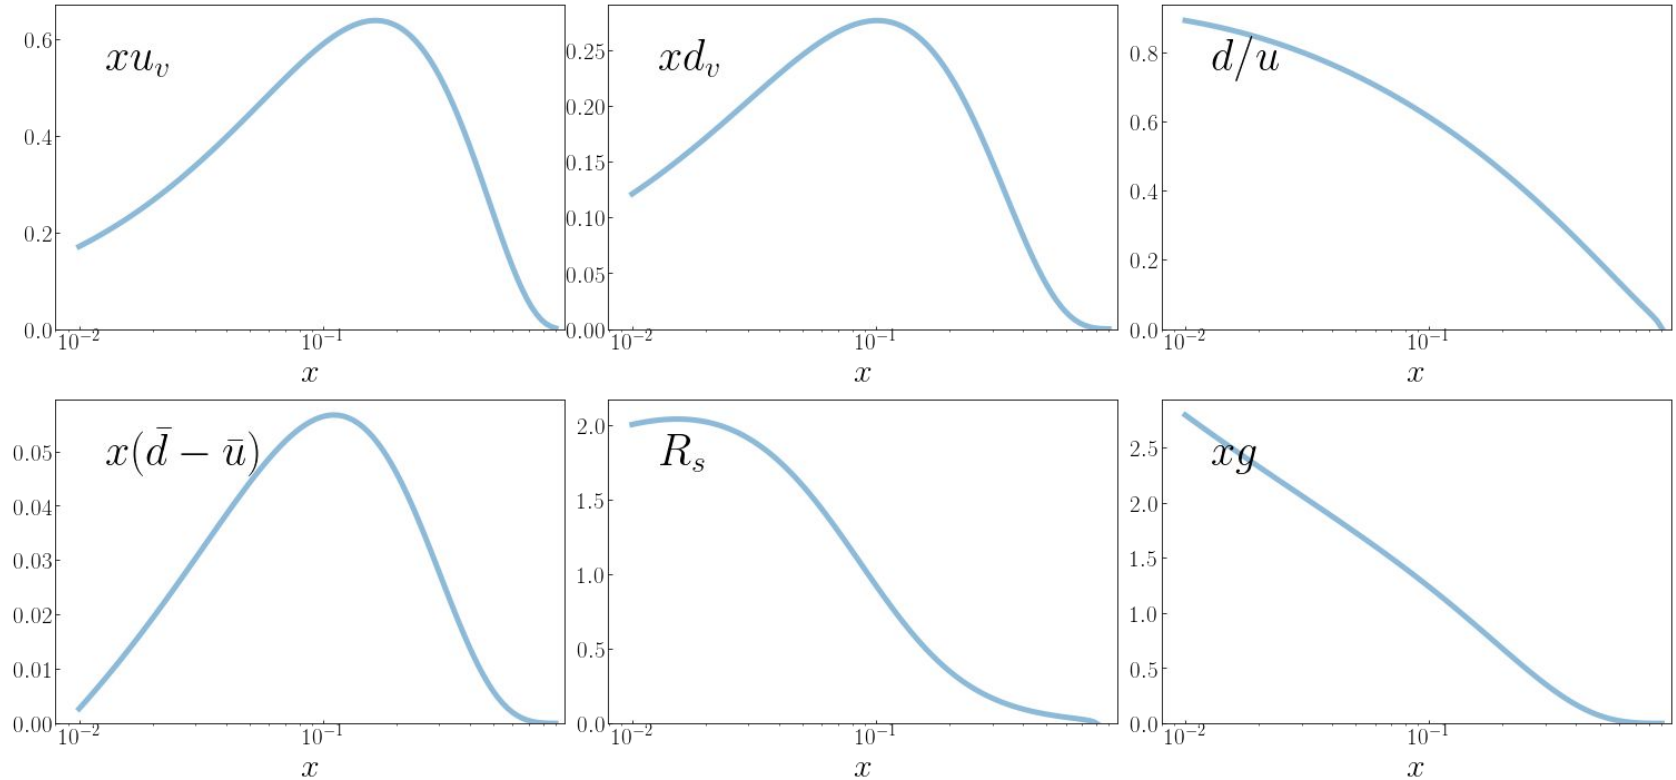

Solve a nonlinear least-squares problem with bounds on the variables.

Given the residuals $f(x)$ (an m -D real function of n real variables) and the loss function $\rho(s)$ (a scalar function of s), `least_squares` finds a local minimum of the cost function $F(x)$:

Continue to
Jupyter notebook

Exercise 12.A (time: 5 mins)

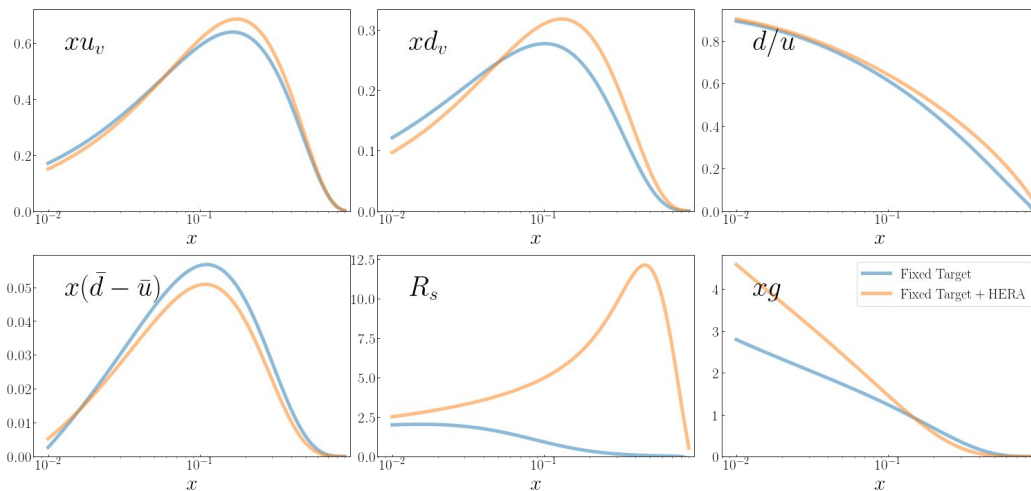

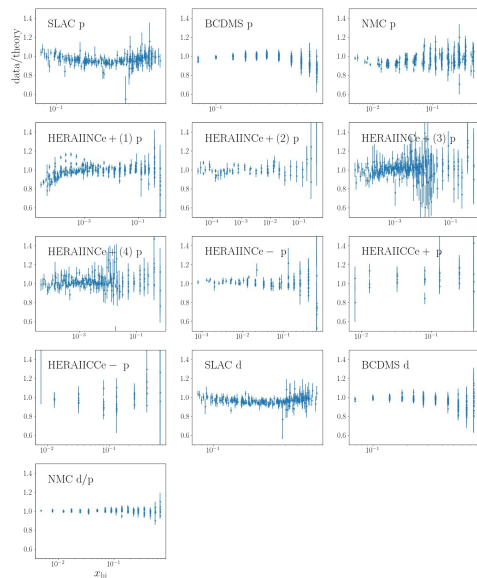

- Plot xu_v , xd_v , d/u , $x(\bar{d} + \bar{u})$, $x(\bar{d} - \bar{u})$, $R_s = (\bar{d} + \bar{u})/(s + \bar{s})$, xg
- hint:** use the method `conf['pdf'].get_xf(x,mu2,flav)`

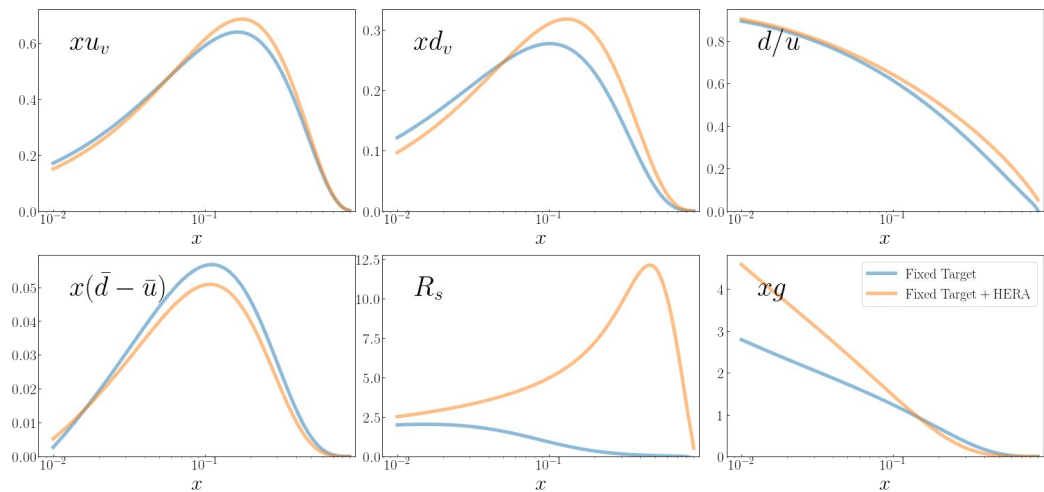

Exercise 12.B (time: 10 mins)

- Include the HERA data sets and run the fitter
- Plot data/theory for all experiments
- Plot the pdfs (as above) from the previous run and the new run
- **hint:**

- use `get_datasets(Q2cut=1.27**2, W2cut=10, ihera=True)`
- assuming you have the two sets of parameters stored as `par1` and `par2`, when making the pdfs plots, use the method `resman.parman.set_new_params(par)` to update the `PDF` class

Bayesian inference

The Bayes theorem

$$\mathcal{L}(\mathbf{a}, \text{data}) = \exp \left[-\frac{1}{2} \chi^2(\mathbf{a}, \text{data}) \right]$$

This is a choice

Min, Max, penalties,
regulators etc

$$\rho(\mathbf{a}|\text{data}) \sim \mathcal{L}(\mathbf{a}, \text{data}) \pi(\mathbf{a})$$

$$\mathbb{E}[\mathcal{O}] = \int d^n a \, \rho(\mathbf{a}|\text{data}) \, \mathcal{O}(\mathbf{a})$$

$$\mathbb{V}[\mathcal{O}] = \int d^n a \, \rho(\mathbf{a}|\text{data}) \, [\mathcal{O}(\mathbf{a}) - \mathbb{E}[\mathcal{O}]]^2$$

This is impractical

How do we deal with the **curse of dimensionality** ?

$$\mathbb{E}[\mathcal{O}] = \int d^n a \, \rho(\mathbf{a}|\text{data}) \, \mathcal{O}(\mathbf{a})$$

$$\mathbb{V}[\mathcal{O}] = \int d^n a \, \rho(\mathbf{a}|\text{data}) \, [\mathcal{O}(\mathbf{a}) - \mathbb{E}[\mathcal{O}]]^2$$

Option 1: Maximum likelihood

$$\mathbb{E}[\mathcal{O}] \simeq \mathcal{O}(\mathbf{a}_0)$$

$\mathbb{V}[\mathcal{O}] = \text{Hessian, Lagrange multipliers}$

Assumes symmetric
likelihood, unique
solution

Assumes Gaussian
behavior around ML

How do we deal with the **curse of dimensionality** ?

$$\mathbb{E}[\mathcal{O}] = \int d^n a \, \rho(\mathbf{a}|\text{data}) \, \mathcal{O}(\mathbf{a})$$

$$\mathbb{V}[\mathcal{O}] = \int d^n a \, \rho(\mathbf{a}|\text{data}) \, [\mathcal{O}(\mathbf{a}) - \mathbb{E}[\mathcal{O}]]^2$$

Option 2: MC approach

Build an MC
ensemble (\$\$\$)

$$\mathbb{E}[\mathcal{O}] \simeq \frac{1}{N} \sum_k \mathcal{O}(\mathbf{a}_k)$$

$$\mathbb{V}[\mathcal{O}] \simeq \frac{1}{N} \sum_k [\mathcal{O}(\mathbf{a}_k) - \mathbb{E}[\mathcal{O}]]^2$$

Many algorithms

- MCMC
- HMC
- **Data resampling**
- ...

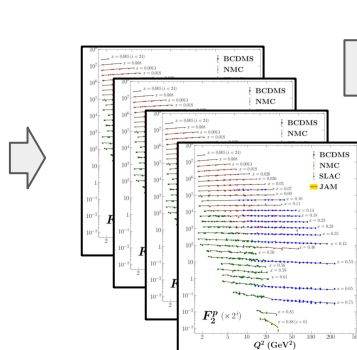

Data resampling

$$d_{k,i}^{(\text{pseudo})} = d_i^{(\text{original})} + \alpha_i R_{k,i}$$

A Possible Resolution of the Strange Quark Polarization Puzzle ?

Elliot Leader, Alexander V. Sidorov, Dimitar B. Stamenov

The strange quark polarization puzzle, i.e. the contradiction between the negative polarized strange quark density obtained from analyses of inclusive DIS data and the positive values obtained from combined analyses of inclusive and semi-inclusive SIDIS data using de Florian et. al. (DSS) fragmentation functions, is discussed. To this end the results of a new combined NLO QCD analysis of the polarized inclusive and semi-inclusive DIS data, using the Hirai et. al. (HKNS) fragmentation functions, are presented. It is demonstrated that the polarized strange quark density is very sensitive to the kaon fragmentation functions, and if the set of HKNS fragmentation functions is used, the polarized strange quark density obtained from the combined analysis turns out to be negative and well consistent with values obtained from the pure DIS analyses.

“...It is demonstrated that the polarized strange quark density is very sensitive to Kaon FF.”

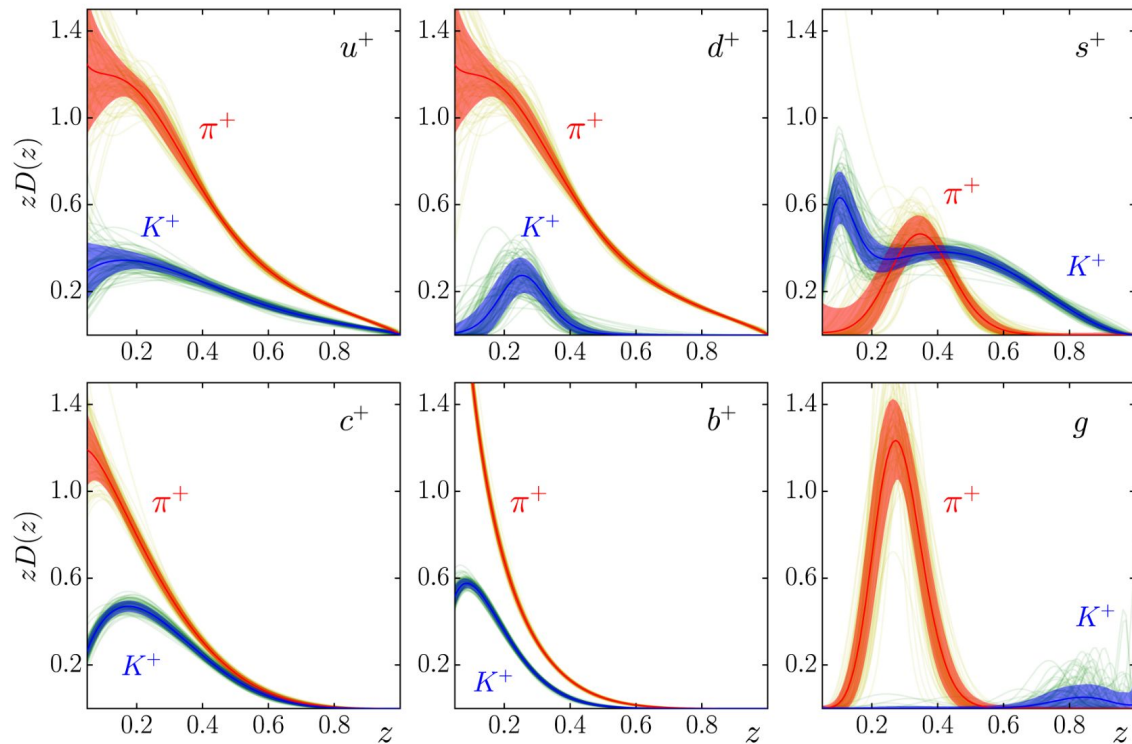

SU(3) constraints:

$$\Delta u^+(1, Q^2) + \Delta d^+(1, Q^2) - 2\Delta s^+(1, Q^2) = a_8,$$

Role of SIDIS and SIA ?

JAM'16 (1D FFs)

NS, Ethier, Melnitchouk, Hirai, Kumano

FF kaon:
JAM closer to DSS at large z

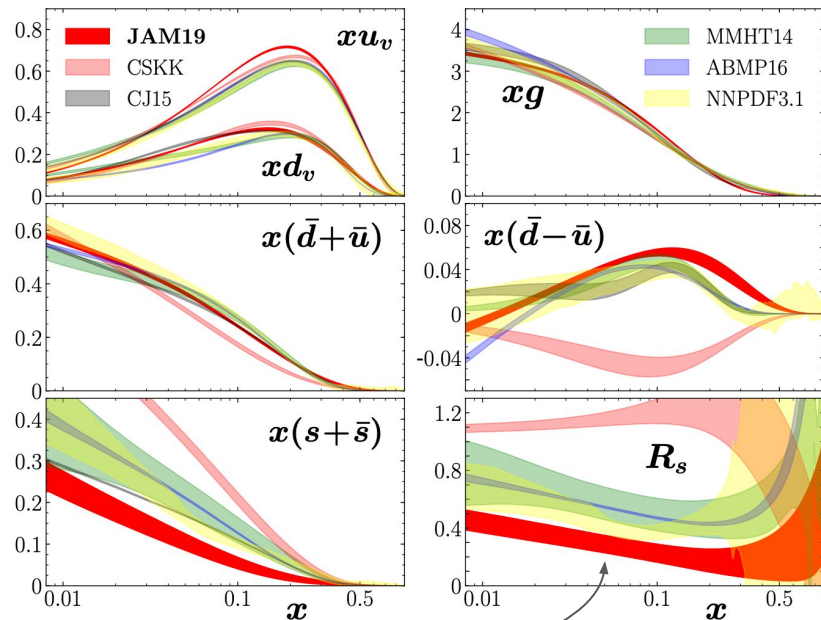

JAM'17 (1D simultaneous extraction of spin PDFs and FFs)

- Use of pol. DIS, SIDIS and SIA
- No SU(2) nor SU(3) constraints
- Empirical evidence of $g_3 \sim g_A$ 2%
- **No strange puzzle - need more data**

JAM'19 (1D simul. extraction of spin-averaged PDFs and FFs)

NS, Andres, Melnitchouk

SIDIS (kaon) suppresses strange PDF

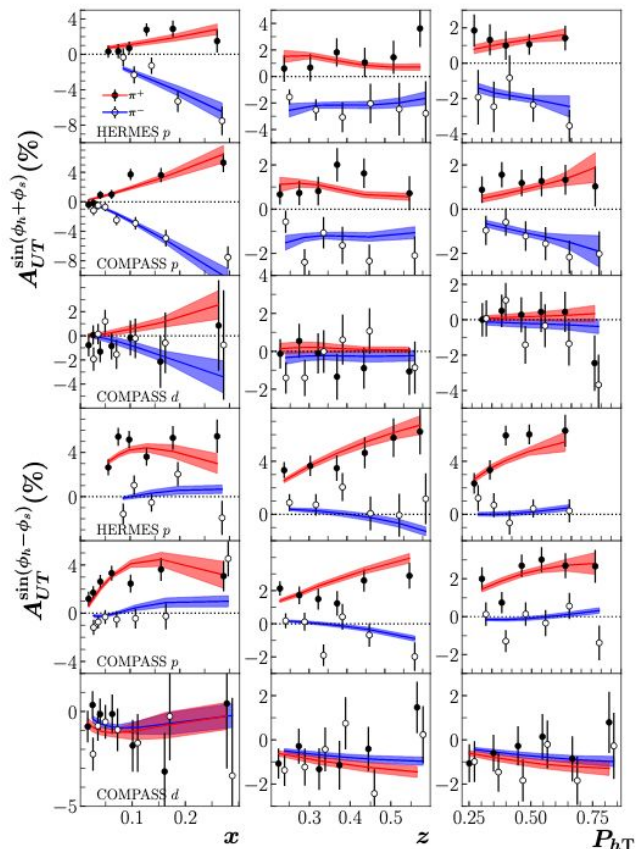

SIA (kaon) prefers large strange -> Kaon FF

Faura, Iranipour, Nocera, Rojo, Ubiali

Strange suppression disfavored by collider W+c data

A_{DY}^{Siv}	$p^\uparrow + p \rightarrow (W^+, W^-, Z) + X$
A_N^h	$p^\uparrow + p \rightarrow (\pi^+, \pi^-, \pi^0) + X$

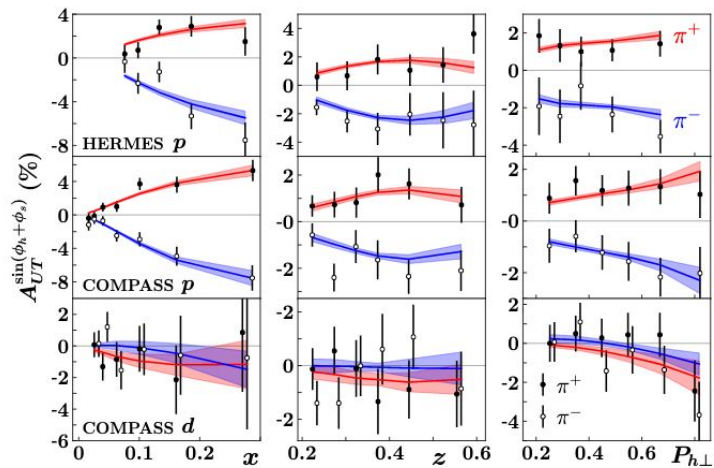

JAM'20 (3D zoo of correlation functions)

Cammarota, Gamberg, Kang, Miller, Pitonyak, Prokudin, Rogers, NS

JAM'18 (3D experiment + lattice QCD: gT moment)

Inclusion of gT as Bayesian prior
can complement experimental data

Lin, Melnitchouk, Prokudin, NS, Shows

JAM'20 (1D experiment + lattice QCD: quasi-PDFs)

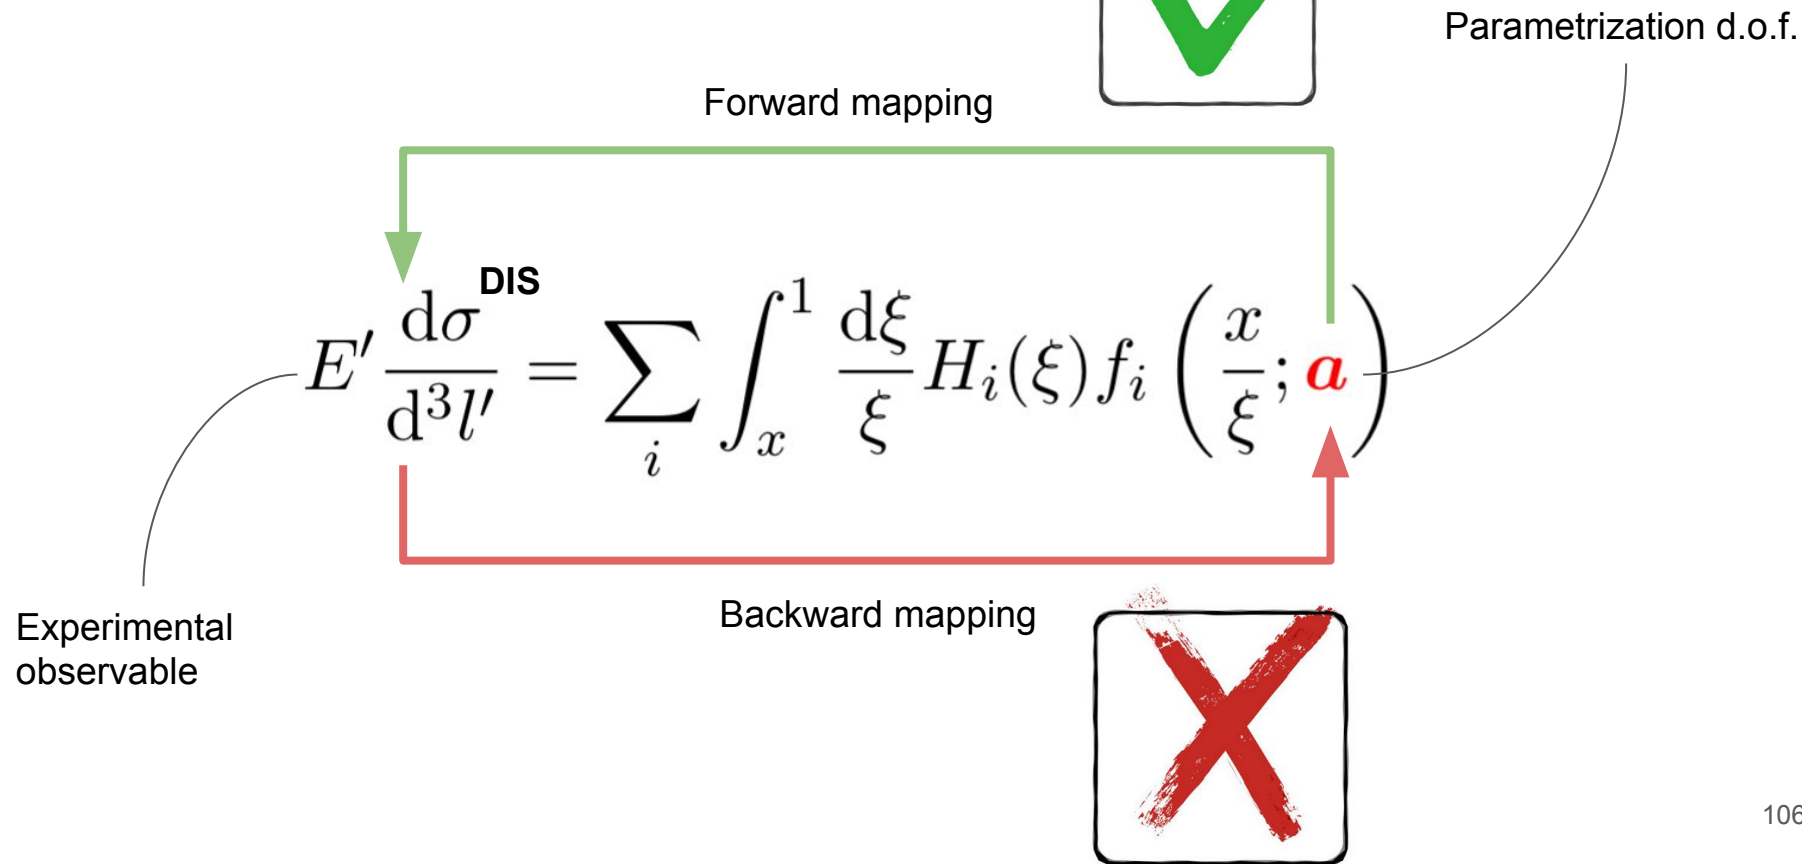

$$\mathcal{M}_q(z, \mu) = \int_{-\infty}^{\infty} dx e^{-ixP_3z} \int_{-1}^1 \frac{d\xi}{|\xi|} C_q\left(\frac{x}{\xi}, \frac{\mu}{\xi P_3}\right) f_q(\xi, \mu)$$

$$\mathcal{M}_{\Delta q}(z, \mu) = \int_{-\infty}^{\infty} dx e^{-ixP_3z} \int_{-1}^1 \frac{d\xi}{|\xi|} C_{\Delta q}\left(\frac{x}{\xi}, \frac{\mu}{\xi P_3}\right) \Delta f_q(\xi, \mu)$$

Machine Learning

The inverse problem

An idea: parametrize the **inverse function**

Observable space

$$E' \frac{d\sigma}{d^3l'}$$

x

Theory

$$E' \frac{d\sigma}{d^3l'} = \sum_i \int_x^1 \frac{d\xi}{\xi} H_i(\xi) f_i\left(\frac{x}{\xi}; \mathbf{a}\right)$$

Parameter space

Neural Nets

Parameter inference

Original data

Replica data

$$\rho(\mathbf{a}|\text{data}) \sim \mathcal{L}(\mathbf{a}, \text{data})\pi(\mathbf{a})$$

Trained inverse mapper

Uncertainty quantification

Parameter inference

So why do we need **inverse mappers**?

1) Manipulate data input

What happens
if we remove
... data ?

Where do we
need more
experiments?

What data are forcing ...
to be ...?

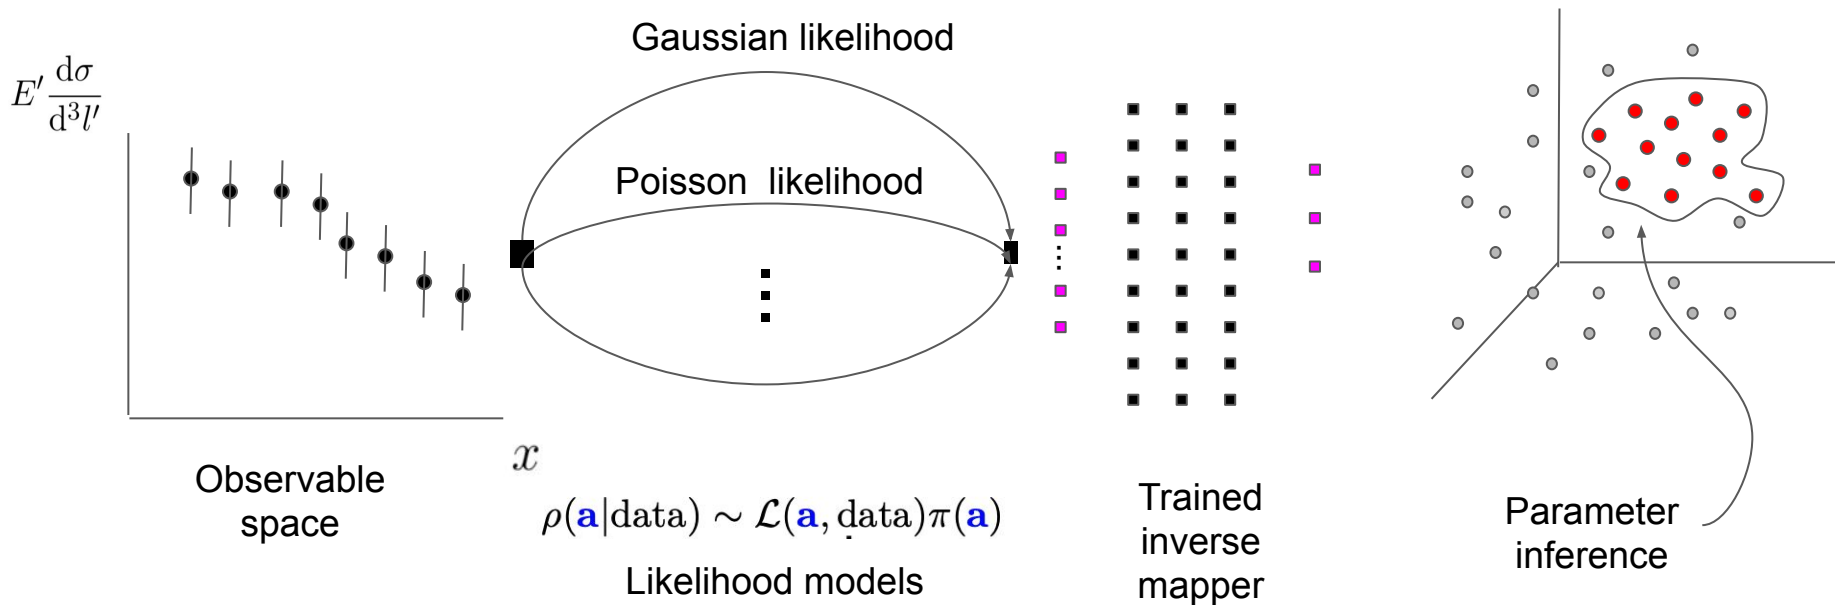

Collecting MC samples
is too expensive

$$\rho(\mathbf{a}|\text{data}) \sim \mathcal{L}(\mathbf{a}, \text{data})\pi(\mathbf{a})$$

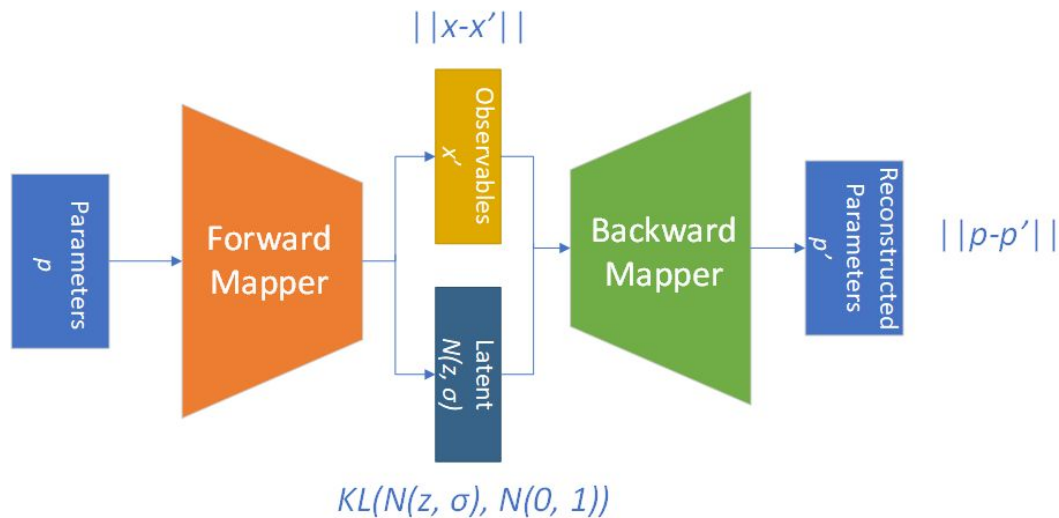

“Global analysis
is a kind of a
sausage” ...
**how to
unpack it?**

2) Bayesian inference modeling

Existing methodologies
are prohibitively expensive
for such studies

Inverse mapper architectures

Designing the **inverse mappers**

Kinematics-independent
inverse mapper

Cross section 1 ($x_1, Q2_1$)

Cross section 2 ($x_2, Q2_2$)

Cross section 3 ($x_3, Q2_3$)

⋮

⋮

x

$Q2$

Cross section

Kinematics dependent
inverse mapper

Parameter
inference

Ambiguity in inverse problems

Forward Mapper

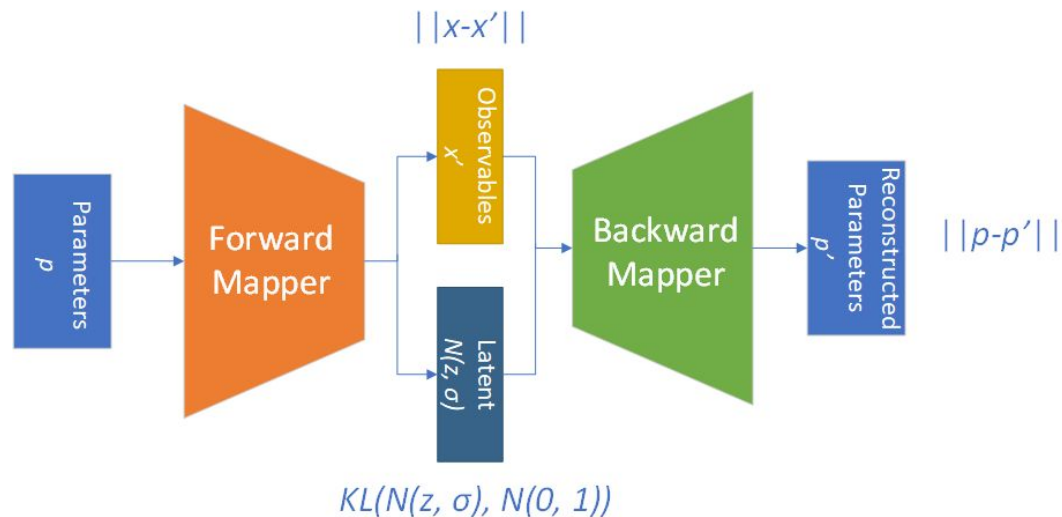

Backward Mapper

Ambiguous

Kinematic-independent inverse mapper: Variational Autoencoder (VAE)

- Better than previous models
- Remove the grid dependence
- Highly accurate
- No Gaussian mixture assumption

Toy problems with multiple solutions

$$f(x) = x^2$$

$$f(x) = x^2$$

$$f(x) = 0.36$$

Two Solutions

$$f(x) = \sin(x)$$

$$f(x) = \sin(x)$$

$$f(x) = 0$$

$$f(x) = \sin(x)$$

$$f(x) = 0.5$$

Multiple Finite Solutions

$$f(x, y) = x^2 + y^2$$

$$f(x, y) = x^2 + y^2$$

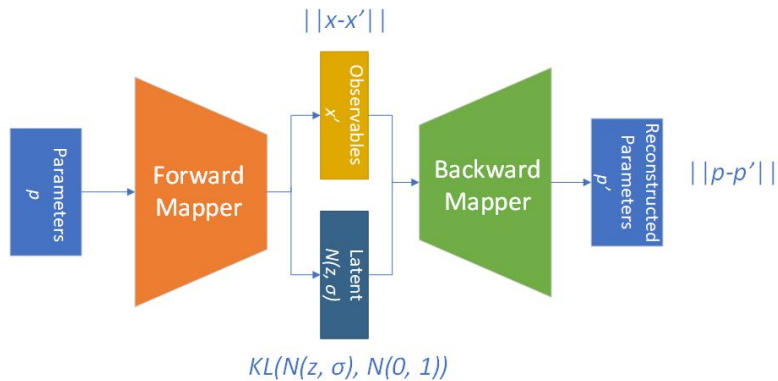

$$f(x, y) = 1.0$$

Infinite Solutions

Does it work for DIS?
