Pre-preliminary 2019 Data Analysis

Cameron Bravo (SLAC)

Introduction

- New types of jobs in hps-mc
 - Generate physics processes with MadGraph and process up to right before running detector sim (slic/geant)
 - Simulate passage of particles through the detector separately for each component of the backgrounds (tritrig, wab, beam) while also merging and running readout and reconstruction
 - Run analysis with hpstr on this reconstructed MC as well as data
- Focusing on run 10031 which was with an 8 um W target and 100 nA beam current, for which the MC software was configured to simulate
- Exclusively looking at Kalman tracks and vertices
- Comparison of data and MC scaled to the expected rate
- What's next?

- Made a small set of MC samples locally to compare to the run hps_010031
 - 200 files of tritrig+beam each with 10,000 tritrig events
 - 2000 files of wab+beam each with 30,000 wab events
 - Done with conditions used for hps_010031 which has an integrated luminosity of 0.1525 pb⁻¹ based on Maurik's lumi script
- All relevant steps use detector HPS_TY_iter4
 - Slightly stale branch of hps-java used, but shouldn't matter that much
 - Special branch of Icsim from PF used

Preselection Cutflows

Tritrig+Beam hps_010031 WAB+Beam ×10⁶ $\times 10^3$ 16 180 20000 18000 14 160 16000 12 140 14000 10 120 12000 100 10000 8000 80 6000 60 2 4000 ₽e⁻ ₹ 3.8 GeV e Track X2 < 30 e* Track X2 < 30 P_e' > 1.0 [GeV] P_e* > 0.5 [GeV] ₽e' ~ 3.8 GeV e Track X2 < 30 e* Track X2 < 30 P_e' > 1.0 [GeV] P_e* > 0.5 [GeV] Pe⁻ ₹ 3.8 GeV P_e' ≥ 1.0 [GeV] P_e* > 0.5 [GeV] e Track X2 no-cuts Track 22 = 30 no-cuts Xe ~ 20 no-cuts Kunc = 20 ×30

- Data includes all triggers while MC readout exclusively uses Singles1 trigger (Ecal Cluster + Hodo Hit)
- FEE cut seems to remove less data than MC

Preselection Track Momentum

- MC is normalized to expected rate for 10031 luminosity
- Expected rate in MC is roughly 2x the data rate

Preselection Track Directions

Asymmetry in top vs bottom not the same in data and MC

Preselection Track Directions

- Shape of Phi_o of positron tracks is fairly close
- Shape of electron tracks is shifted away from zero a bit in MC

Preselection Track Extrapolations

- d_o is much higher on average in data for positrons and electrons
- Do we need to use a different beam spot in MC?

Preselection Track Extrapolations

- The shape of z₀ is clearly off for both tracks
- Electrons are maybe worse than positrons?

Preselection Psum

 Psum does not peak nearly as much in data

Preselection Vertex Mass

 Still need to spin up a rad+beam sample to be able to calculate the radiative fraction

Tight Selection Cutflows

hps_010031 Tritrig+Beam WAB+Beam 1400 ×10³ 4000 50000 1200 3500 45000 1000 3000 40000 35000 2500 800 30000 2000 600 25000 1500 20000 400 1000 15000 500 200 10000 P. + P. - 4.0 GeV Per + Per 24.0 Gev Per + Per >4.0 GeV LILI no-cuts no-cuts no-cuts X2 56 LILI $N_{v_{x}=1}$ X2 56 LILI X2 56 $N_{v_{x}=1}$

- Data includes all triggers while MC readout exclusively uses Singles1 trigger (Ecal Cluster + Hodo Hit)
- FEE cut seems to remove less data than MC

Tight Selection Track Momentum

Electron Momentum Positron Momentum 50000 60000 HPS Internal HPS Internal 2019 MC 2019 MC Tracks / 200 MeV Tracks / 200 MeV 50000 40000 tritrig+wah 40000 30000 30000 20000 20000 10000 10000 mhunhunhun 5 5 Ratio Ratio 4 3 3 '旨 0 <u></u> 5 ō 0.5 1.5 2 2.5 3 3.5 4.5 0.5 1.5 2 2.5 3 3.5 4.5 5 1 4 1 4 p_{e⁺} [GeV] p_e [GeV]

- Shapes match much better with Tight selection
- Rate is off by roughly a factor of 3 to 4

Tight Selection Track Directions

- Asymmetry in top vs bottom not the same in data and MC
- Shapes don't look so bad

Tight Selection Track Directions

- Shape of electron tracks is shifted away from zero a bit in MC
- Shape of positron tracks seems funny to me

Tight Selection Track Extrapolations

The shape of d_o is clearly off for both tracks still

Tight Selection Track Extrapolations

- The shape of z₀ is clearly off for both tracks
- The direction of the asymmetry seems backwards?

Tight Selection Psum

This doesn't look much different from preselection apart from the minimum requirement

•

Tight Selection Vertex Mass

Shape is definitely closer than it is with only the preselection, but still not quite right

•

Discussion

- Data/MC rate is about 1/3
- Some of the variable shapes sorta match, but most don't
- The funny asymmetries in tan(λ) and Z₀ are potentially a hint into what we might be missing?
 - Missing positron tracks in the top and electron tracks in the bottom?
 - Minus sign somewhere flipping top and bottom in data or MC but not both?
 - Just some crazy ideas
- I have more plots, and can pull them up if we want

- Lots to get merged into master of hps-java and hps-mc
- Will take a well coordinated effort
- Get setup to quickly repeat comparisons like this one for new detectors
 - This mostly is accomplished via the software organization
 - Also need to make a larger set of generator level files
- I am already starting to run even more beam files with different target thicknesses and beam currents
