Prior photoproduction data at this energy is sparse.

SLAC
\[
\begin{align*}
\gamma p & \rightarrow \rho p \quad \sim 3.5 \text{ k events} \\
\gamma p & \rightarrow \omega p \quad \sim 1.0 \text{ k events} \\
\gamma p & \rightarrow \phi p \quad \sim 150 \text{ events}
\end{align*}
\]

GlueX 1
\[
\begin{align*}
\gamma p & \rightarrow \rho p \quad \sim 200 \text{ M events} \\
\omega & \rightarrow \pi^+ \pi^- \pi^0 \quad \sim 9 \text{ M events} \\
\varphi & \rightarrow K^+ K^- \quad \sim 1.8 \text{ M events}
\end{align*}
\]
Spin Density Matrix Elements

Angular distribution of vector meson decay products gives access to production mechanism.

Linear beam polarization provides access to 9 SDMEs

Measured Intensity

\[ I(\Omega) \propto W(\cos\theta, \phi, \Phi) \]

\[ W(\cos\theta, \phi, \Phi) = W^0(\cos\theta, \phi) - P_\gamma \cos(2\Phi)W^1(\cos\theta, \phi) - P_\gamma \sin(2\Phi)W^2(\cos\theta, \phi) \]

\[ W^0(\cos\theta, \phi) = \frac{4}{3\pi} \left( \frac{1}{2}(1 - \rho_{00}) + \frac{1}{2}(3\rho_{00} - 1)\cos^2\theta - \sqrt{2}\text{Re}\rho_{10}\sin2\theta\cos\phi - \rho_{1-1}\sin^2\theta\cos2\phi \right) \]

\[ W^1(\cos\theta, \phi) = \frac{4}{3\pi} \left( \rho_{11}\sin^2\theta + \rho_{01}\cos^2\theta - \sqrt{2}\text{Re}\rho_{10}\sin2\theta\cos\phi - \rho_{1-1}\sin^2\theta\cos2\phi \right) \]

\[ W^2(\cos\theta, \phi) = \frac{4}{3\pi} \left( \sqrt{2}\text{Im}\rho_{10}\sin2\theta\sin\phi + \text{Im}\rho_{1-1}\sin^2\theta\sin2\phi \right) \]
Regge model fit to cross section and SDME data from SLAC.

$s$ channel helicity conservation SCHC

\[ \rho_{1-1}^1 = -\text{Im} \rho_{1-1}^2 = 0.5 \]
at \( t \to 0 \)

\( \omega \) has largest uncertainties

\( \omega \) deviates from SCHC due to \( \pi \) exchange
Will focus on $\gamma p \rightarrow \omega p$, other vector mesons also under analysis.

Backgrounds are small in the forward region subtracted using sidebands. SDMEs extracted with unbinned extended maximum likelihood fits in 3D space in each bin of -t.

\[
\gamma p \rightarrow p\pi^+\pi^-\pi^0
\]

\[
\gamma p \rightarrow p\gamma\pi^0
\]

$\omega$ SDMEs

$\gamma p \rightarrow \omega p$

$\omega \rightarrow \pi^+\pi^-\pi^0$

Logarithmic in $t$

All GlueX 1 data

Uncertainty dominated by systematics

Agree with JPAC for most SDMEs at moderate $t$ (consistent with factorization of Regge residues)

DNP 2020 Preliminary
\( \rho \) SDMEs

\( \gamma p \to \rho p \)

Released MENU 2019

\( \sim \) 20\% of GlueX 1 data

Uncertainty dominated by systematics

Agree with JPAC and SCHC at low \( t \)

(consistent with factorization of Regge residues)

Publication in preparation

\[ A_{\text{M}} \]
Lessons from SDMEs

natural-parity exchanges are predominantly helicity conserving

ω production unnatural-parity consistent with a one-pion exchange

t dependence less important for SDMEs since it largely cancels in the ratio

Statistics limit SDME measurements to low t

helicity transfer: 0, 1 or 2

Factorizes in to 2 vertices and a Regge factor

FIG. 10. \( \gamma p \to (\rho^0, \omega, \phi) p \) differential cross section at 9.3 GeV
Vector meson cross section

Describing the cross section energy and momentum dependence requires good understanding of production mechanisms

Small angle, Pomeron and t-channel Reggeons

Large angle, exclusive meson production can be understood in a perturbative way at the level of effective parton degrees of freedom

\[ \text{GlueX} \]
Scattering picture, -t dependence

low t: diffractive scattering of the hadronic contents of the photon (wide energy range, threshold to HERA energies)

high t: partonic description of hard scattering mechanisms

GlueX energy: pomeron only exchange, good description of low t dependence but not of energy dependence.

\[
\frac{d\sigma}{dt} \propto |F_1(t)F_V(t)|^2
\]

\[
F_1(t) = \frac{4m_p^2 - 2.8t}{4m_p^2 - t} \cdot \frac{1}{(1 - t/t_0)^2}
\]

\[
F_V(t) = \frac{1}{1 - t/m_\omega^2} \cdot \frac{2\mu_0^2 + m_\omega^2}{2\mu_0^2 + m_\omega^2 - t}
\]

dipole approximation of the nucleon Dirac form factor

empirical form factor at the photon vertex

\[\omega \rightarrow \pi^+\pi^-\pi^0\]
Stamp plots, $\omega \rightarrow \pi^+\pi^-\pi^0$, 50% of GlueX phase 1

Preliminary
Total Cross Section

Obtained using model extrapolations of \(-t \to 0\)

Uncertainties systematics dominated (preliminary)

Shows good agreement with model by Laget \((P + f_2 + \pi \text{ exchange})\)
Constituent Counting Rules

High energy at fixed $\cos\theta_{\text{cm}}$ and $s, t \gg M_p^2$

\[
\frac{d\sigma}{dt} \propto s^{-(n-2)}
\]

\begin{align*}
  n_e &= 1 \quad \text{elementary} \\
  n_m &= 2 \quad \text{meson} \\
  n_B &= 3 \quad \text{baryon} \\
  n_\gamma &= 1 \quad \text{point like} \\
  n_{\gamma} &= 2 \quad q\bar{q} \text{ configuration}
\end{align*}

$n$ is the minimal number of constituents involved

\begin{align*}
  n_{\text{tot}} &= 3+3+2+1 = 9 \\
  n_{\text{tot}} &= 3+3+2+2 = 10
\end{align*}

Fits of CLAS data $\omega \to \pi^+\pi^-\pi^0$

PhysRevD.90.014013 Dey

GlueX will produce cross sections at $\cos\theta = 0$ up to $s \approx 17 \text{ GeV}^2$

Could be explained by additional gluon exchanges

arxiv:2005.13067 Reed obtain $s^{-9.08\pm0.11}$
Conclusion

Vector meson photoproduction is a fruitful place to study QCD and understand reaction mechanisms.

GlueX: precise, high statistics data to study energy and t dependence. statistical precision increased by orders of magnitude over existing data.

Work with JPAC to refine model using both cross section and polarization (SDME) data.

Access to hard scattering cross sections up to $s \approx 17 \text{ GeV}^2$
