QCD coupling α_s

- Determines **strength of the strong interaction** between quarks & gluons.
- **Single free parameter of QCD** in the $m_q \rightarrow 0$ limit.
- Determined at a ref. scale ($Q=m_Z$), decreases as $\alpha_s \sim \ln(Q^2/\Lambda^2)^{-1}$, $\Lambda \sim 0.2$ GeV

$$\alpha_s(M_Z) = 0.110^{+0.006}_{-0.008} \text{ (NLO)}$$

G. Altarelli, Ann. Rev. Nucl. Part. Sci. 39, 1989

Summary: α_s from hadronic EW bosons decays

■ World-average QCD coupling at N^{2,3}LO today:

- Determined from **7 observables** with combined **$\pm 0.85\%$ uncertainty**: *Least well-known gauge coupling.*
- Impacts **all LHC QCD x-sections & decays**.
- Role **beyond SM**: GUT, EWK vacuum stability, New coloured sectors?

■ Uncerts. for e⁺e⁻ extractions today:

- τ decays: $\pm 1.5\%$ (mostly non-pQCD)
- Shapes, jets: $\pm 2.6\%$ (mostly non-pQCD)
- Z pseudo-observ.: $\pm 2.5\%$ (mostly exp.)

■ New Z, W extractions:

- Z boson: New fit with high-order EW corrections + updated LEP data: **$\pm 2.3\%$, $\pm 0.6\%$, (exp., th.) unerts.**
- W boson: New **N³LO** fit to Γ_W , R_W **$\sim 47\%$, $\sim 27\%$ (param., exp.) unerts.**

■ Future: 0.1% uncertainty possible with a machine like FCC-e⁺e⁻

Possible detector improvements to bring propagated syst. uncert. on W,Z pseudo-observ. below 0.1%

FCC-ee (91 GeV) syst. uncertainties

- ◆ FCC-ee goal: Via Z line-shape scan, determine Z parameters to precisions:

$$\delta M_Z = 100 \text{ keV} ; \quad \delta \Gamma_Z = 25 \text{ keV}$$

□ Plot shows relative change in cross section across Z resonance for parameter variation of this size

- ◆ Z width measurement most demanding: Need relative normalisation to about 10^{-5}

□ Need statistics of order 10^{10}

□ Need careful control of energy dependent effects

α_s from hadronic τ -lepton decays

➤ Computed at **N³LO**: $R_\tau \equiv \frac{\Gamma(\tau^- \rightarrow \nu_\tau + \text{hadrons})}{\Gamma(\tau^- \rightarrow \nu_\tau e^- \bar{\nu}_e)} = S_{\text{EW}} N_C (1 + \sum_{n=1}^4 c_n \left(\frac{\alpha_s}{\pi}\right)^n + \mathcal{O}(\alpha_s^5) + \delta_{\text{np}})$

➤ Experimentally: $R_{\tau, \text{exp}} = 3.4697 \pm 0.0080$ ($\pm 0.23\%$)

➤ Various pQCD approaches
(**FOPT vs CIPT**) & treatment
of **non-pQCD corrections**
 $(\Lambda/m_\tau)^2 \sim 2\%$, yield
different results.

Uncertainty slightly increased:
2013 ($\pm 1.3\%$) $\rightarrow$ 2019 ($\pm 1.5\%$)

$$\alpha_s(M_Z^2) = 0.1187 \pm 0.0018 \quad (\pm 1.5\%)$$

➤ Future :

- TH: Better understanding of **FOPT vs CIPT differences**.
- **Better spectral functions** needed (high stats & better precision):
B-factories (BELLE-II)?
- High-stats: $\mathcal{O}(10^{11})$ from $Z \rightarrow \tau\tau$ at FCC-ee(90) : $\delta\alpha_s/\alpha_s \ll 1\%$

➤ Computed at $N^{2,3}\text{LO}+N^{(2)}\text{LL}$ accuracy.

➤ Experimentally (LEP):
Thrust, C-parameter, jet shapes
3-jet x-sections

➤ Results sensitive to non-pQCD
(hadronization) accounted for
via MCs or analytically:

➤ Future: $\delta\alpha_s/\alpha_s < 1\%$

- FCC- e^+e^- : Lower- $\sqrt{s}$ (ISR) for shapes, higher- $\sqrt{s}$ for jet rates
- TH: Improved ($N^{2,3}\text{LL}$) resummation for rates, hadronization for shapes

$$\tau = 1 - \max_{\hat{n}} \frac{\sum |\vec{p}_i \cdot \hat{n}|}{\sum |\vec{p}_i|}$$

$$C = \frac{3}{2} \frac{\sum_{i,j} |\vec{p}_i| |\vec{p}_j| \sin^2 \theta_{ij}}{(\sum_i |\vec{p}_i|)^2}$$

➤ Modern jet substructure techniques:
“Soft drop” can help reduce non-pQCD corrections for thrust:

α_s from lattice QCD

- Comparison of short-distance quantities (Wilson loops, q static potential, vacuum polariz.,...) computed at NNLO in pQCD, to lattice QCD “data”:

$$K^{\text{NP}} = K^{\text{PT}} = \sum_{i=0}^n c_i \alpha_s^i$$

[FLAG Collab. <http://itpwiki.unibe.ch/flag>]

- Currently, it's extraction with **smallest uncertainties: $\pm 1\%$** (lattice spacing & statistics).

Extracted value depends on observables:

Uncertainty **increased**:
2013 ($\pm 0.4\%$) $\rightarrow$ 2017 ($\pm 1.0\%$)

- Future prospects:

- **Uncertainty in α_s could be halved** with (much) better numerical data.
- Reaching **$\pm 0.1\%$ requires 4th-loop** perturbation theory (~10 years?)

Other α_s extractions (not yet in world average)

- There are few other classes of e^+e^- observables, computed today at lower accuracy (NLO, NNLO*), that can be used to extract the QCD coupling:

α_s from photon QCD structure function (NLO)

➤ Computed at **NNLO**: $\int_0^1 dx F_2^\gamma(x, Q^2, P^2) = \frac{\alpha}{4\pi} \frac{1}{2\beta_0} \left\{ \frac{4\pi}{\alpha_s(Q^2)} c_{LO} + c_{NLO} + \frac{\alpha_s(Q^2)}{4\pi} c_{NNLO} + \mathcal{O}(\alpha_s^2) \right\}$

➤ Poor $F_2^\gamma(x, Q^2)$ experimental measurements:

➤ Extraction (NLO) with **large exp. uncertainties** today:

$$\alpha_s(m_z) = 0.1198 \pm 0.0054$$

$$(\pm 4.5\%)$$

[M.Klasen et al. PRL89 (2002)122004]

➤ Future prospects:

- Fit with NNLO F_2^γ evolution (ongoing)
- **Better data** badly needed: Belle-II ?
- Dedicated simul. studies at **ILC** exist:
- Huge $\gamma\gamma$ (EPA) stats at **FCC-ee** will lead to: $\delta\alpha_s/\alpha_s < 1\%$
