Streaming Readout for the Next Generation of Electron Beam Experiments

Marco Battaglieri
Jefferson Lab/INFN
(for JLab SRO Team)

Present & future

Jefferson Lab: CLAS12

*Primary Beam: Electrons

* Beam Energy: 12 GeV

- $10 > \lambda > 0.1$ fm
- nucleon \rightarrow quark transition
- baryon and meson excited states

* 100% Duty Factor (cw) Beam

- coincidence experiments
- Four simultaneous beams
- Independent E and I

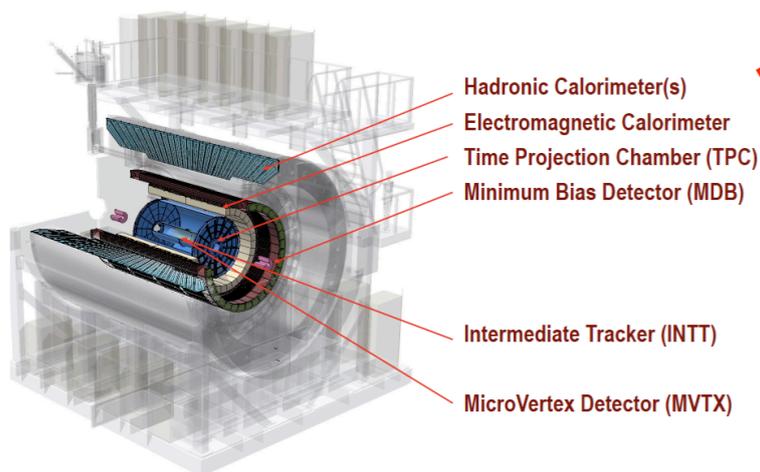

* Polarization

- spin degrees of freedom
- weak neutral currents

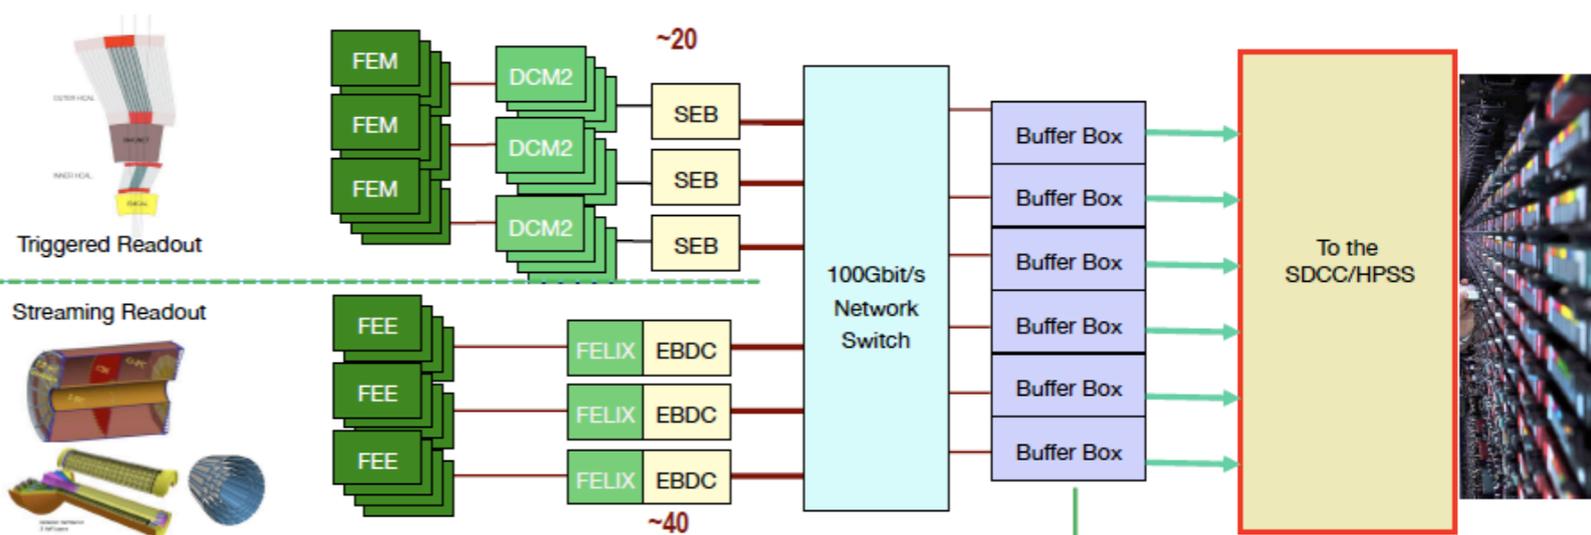

Luminosity $> 10^7 - 10^8 \times$ SLAC

at the time of the original DIS experiments!

BNL: sPHENIX

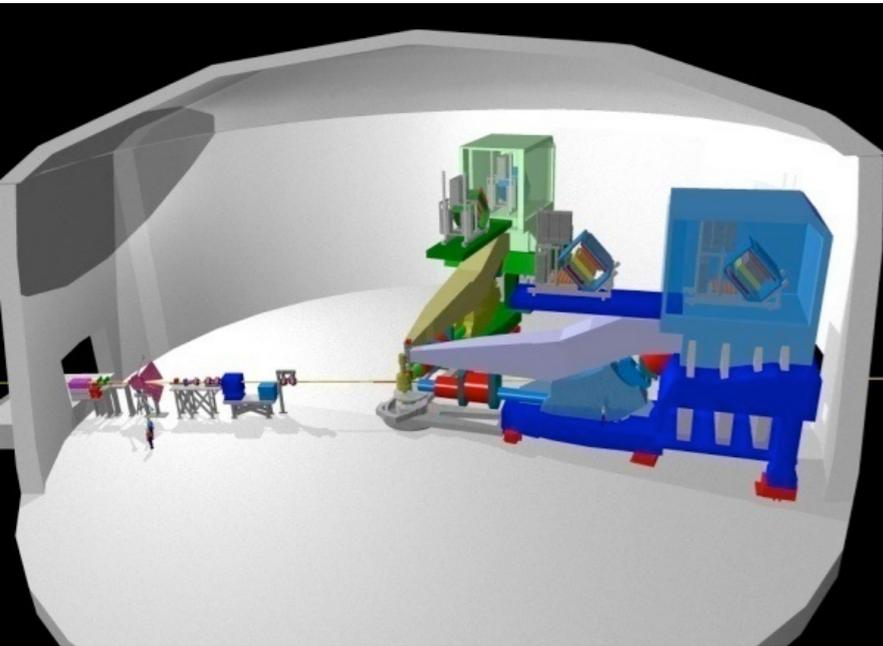

Jin talk!

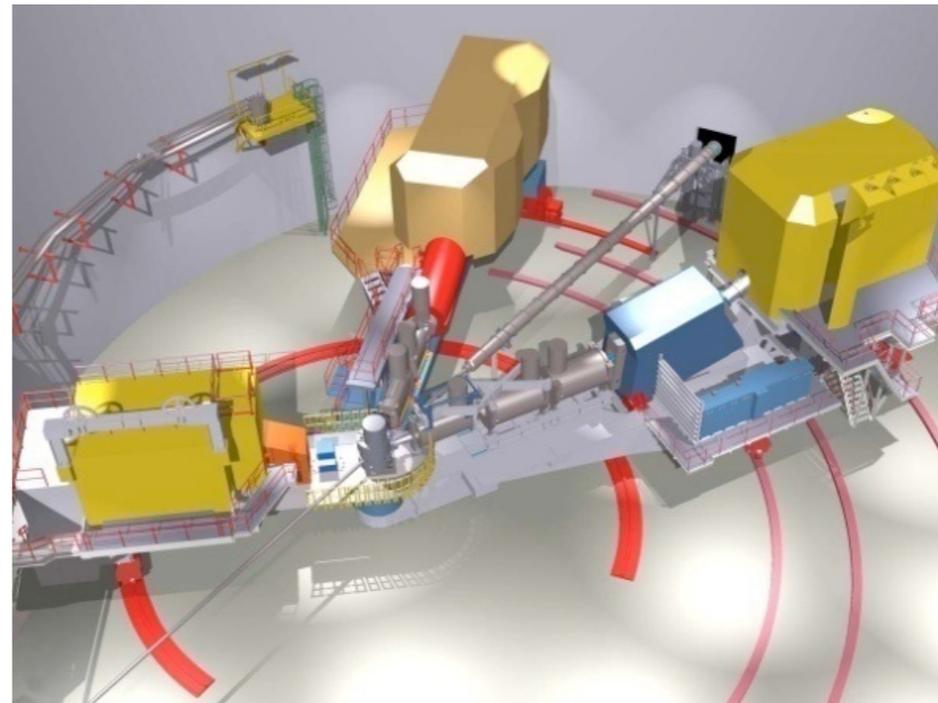

Present & future

Hall A – High Resolution Spectrometers and new multipurpose large acceptance detectors

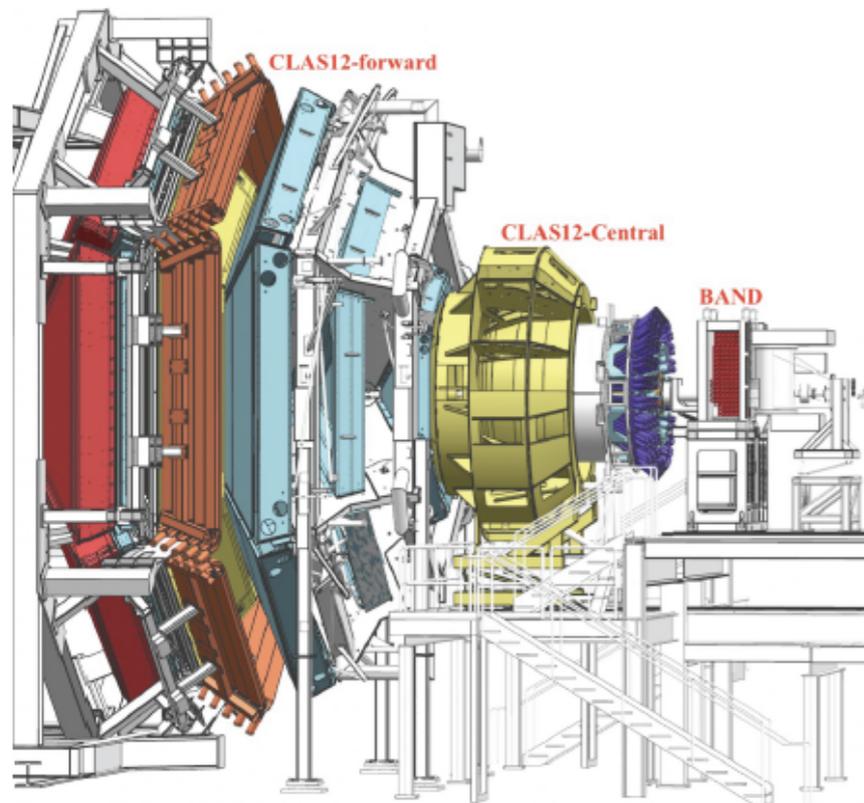

short range correlations, form factors, and future new experiments
current: SBS
future: MOELLER, SOLID

Hall C – Super High Momentum Spectrometer (SHMS)

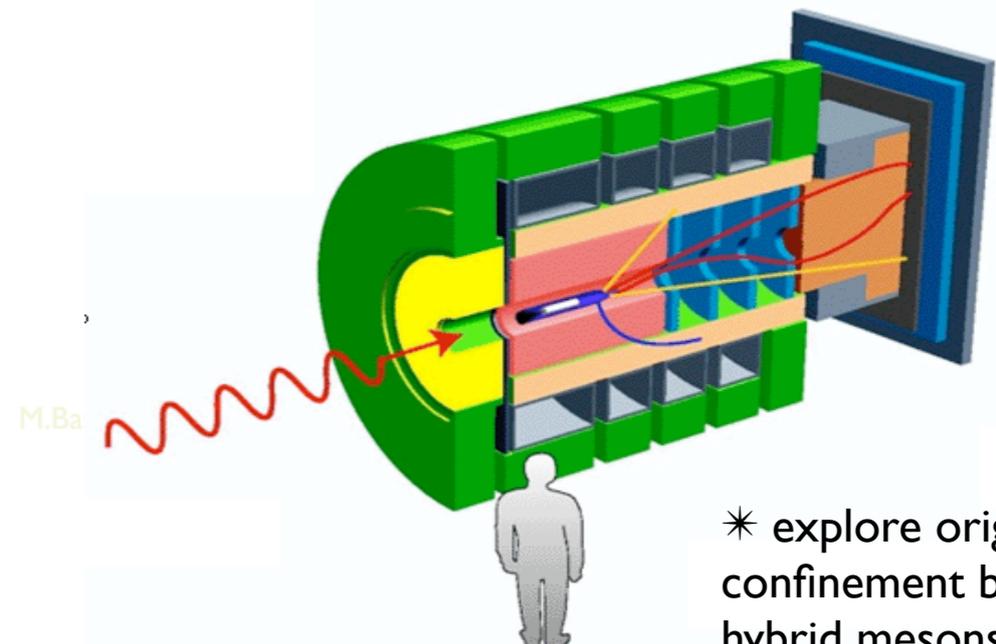

* precise determination of valence q properties in nucleons and nuclei, CPS

Hall B – Large acceptance detector CLAS12 for high luminosity measurements ($10^{35} \text{cm}^{-2} \text{s}^{-1}$)

* Understanding nucleon structure via GPDs and TMDs and hadron spectroscopy

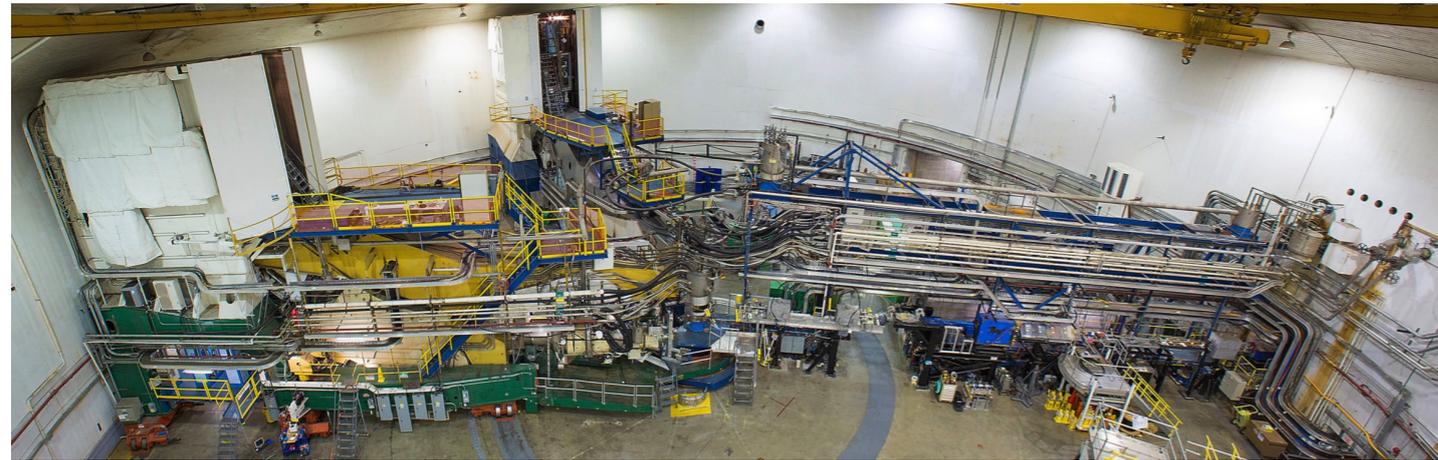

Hall D – GLUEx detector for photoproduction experiments

* explore origin of confinement by studying hybrid mesons

Present & future

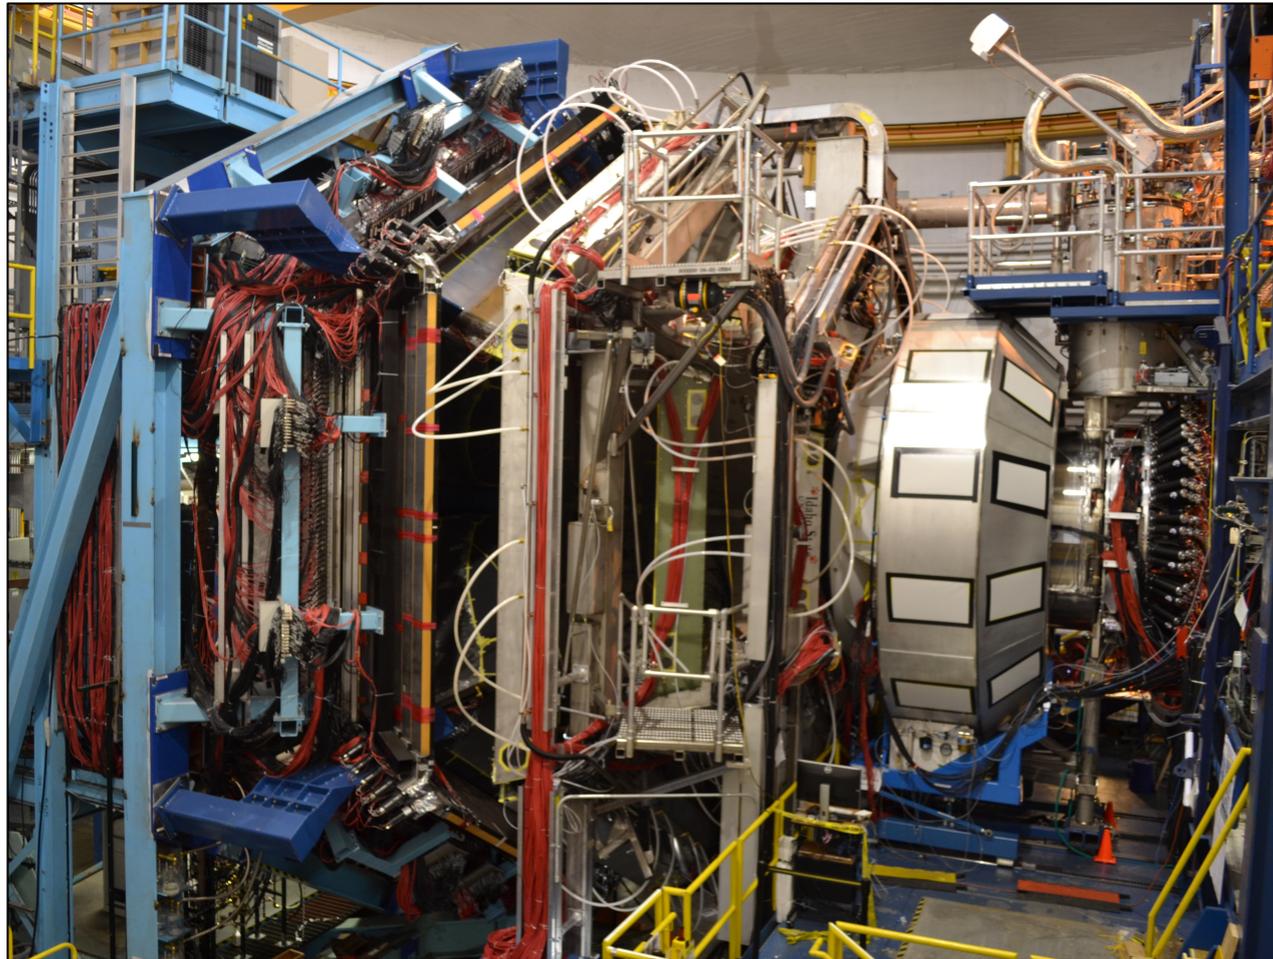

Hall A

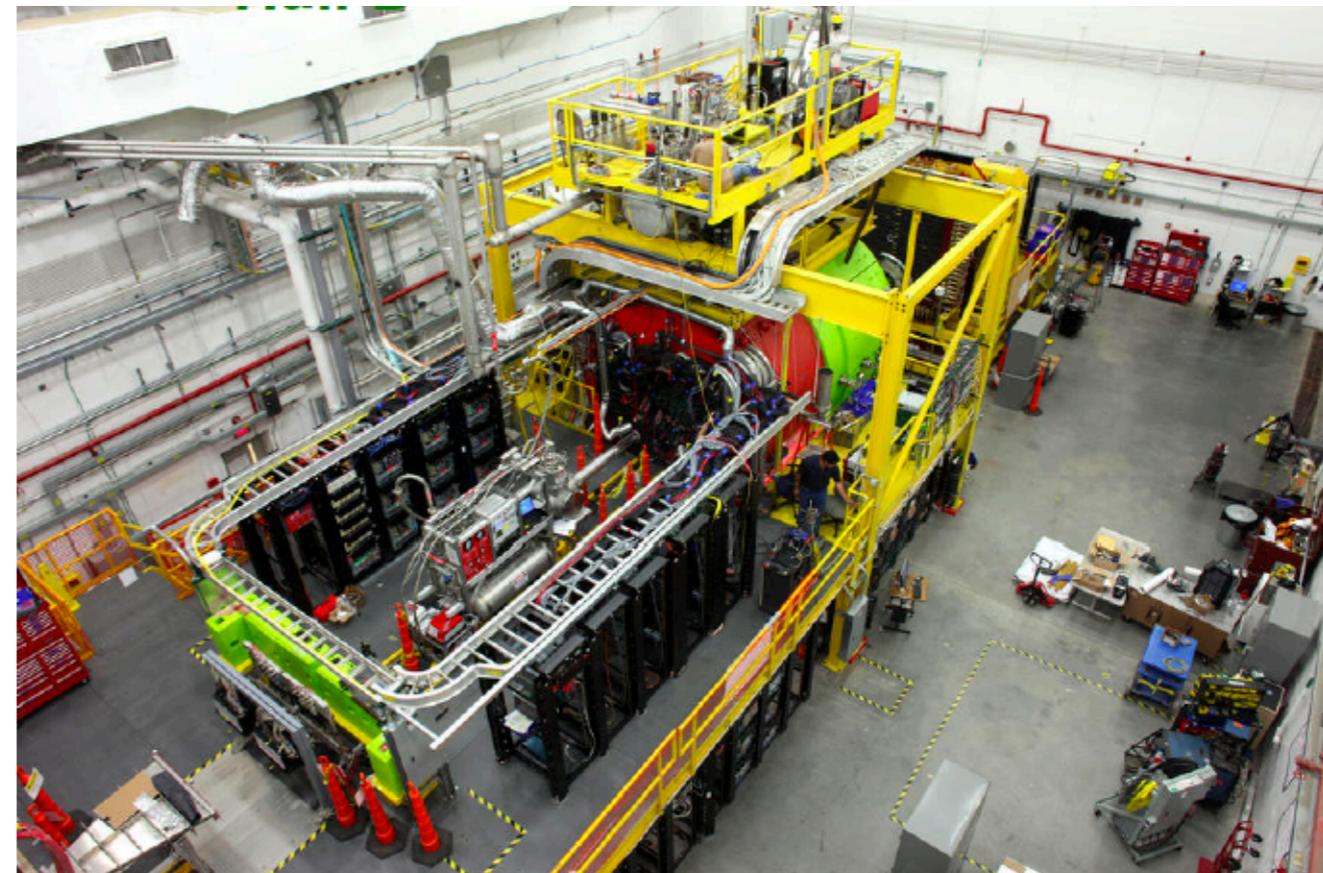

Hall C

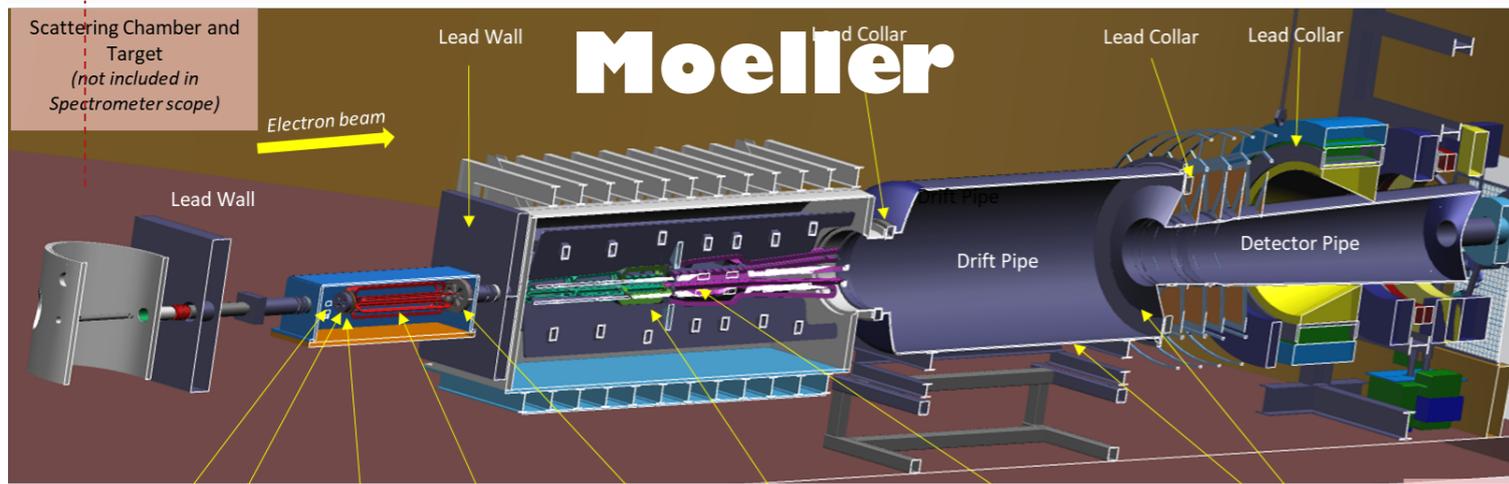

Hall B

Hall D

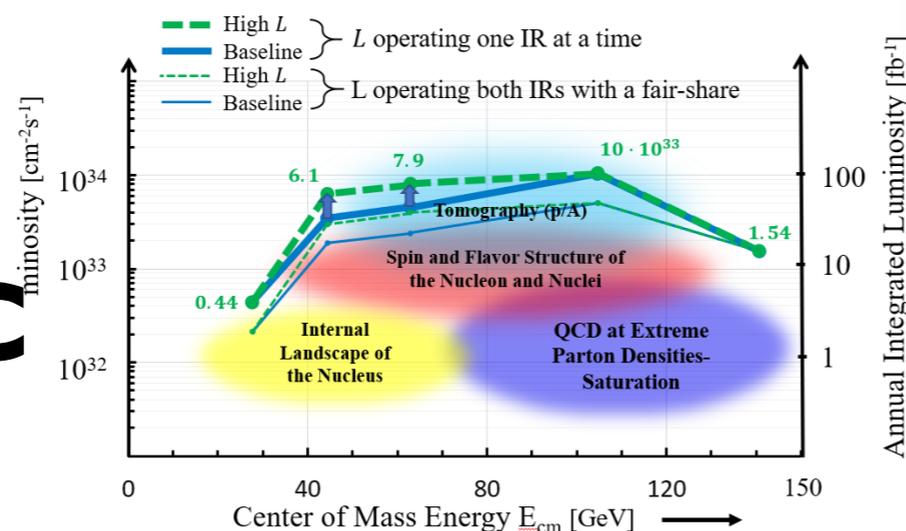

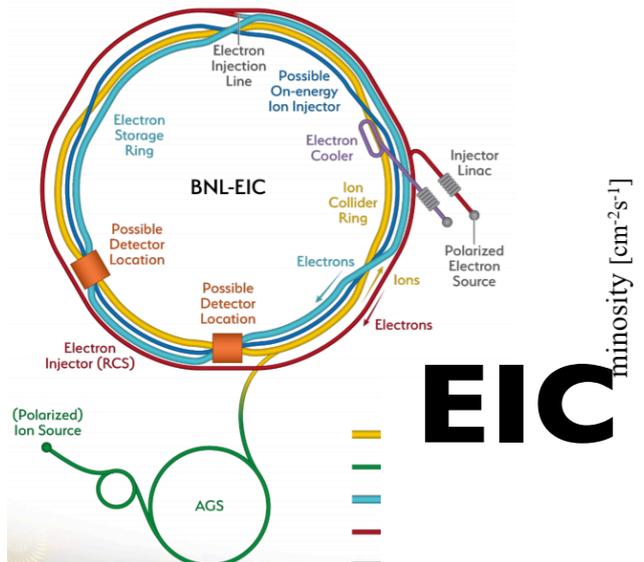

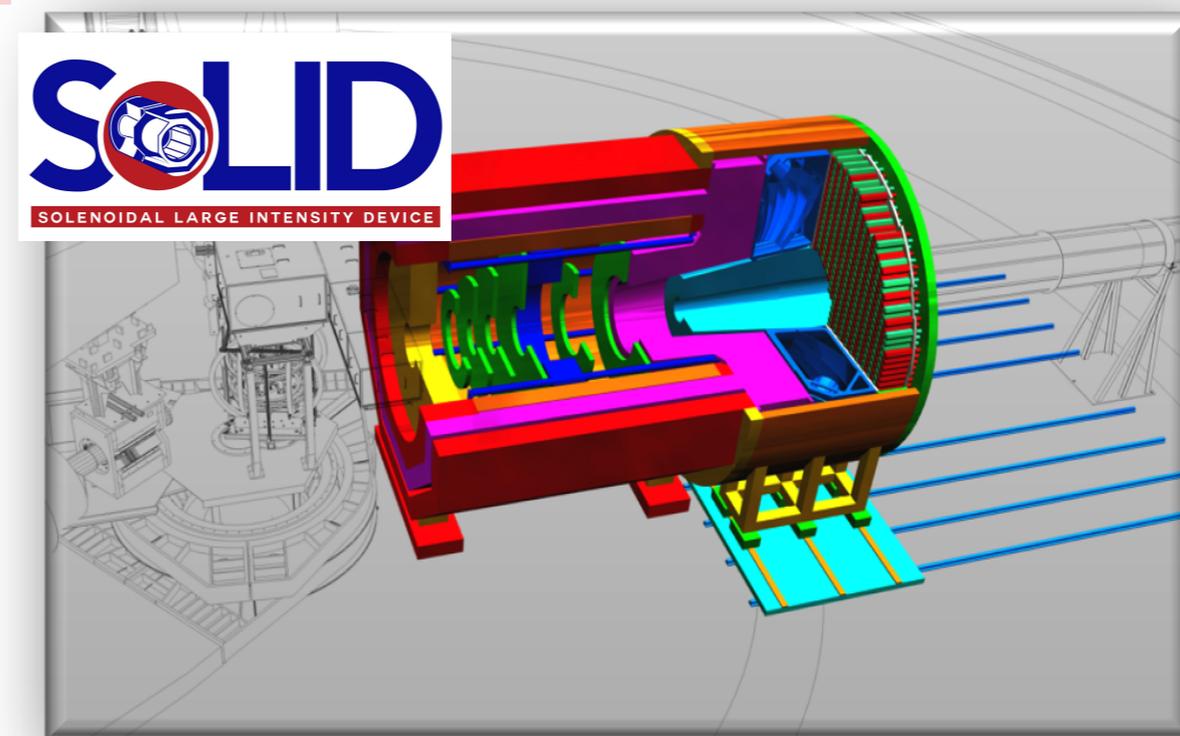

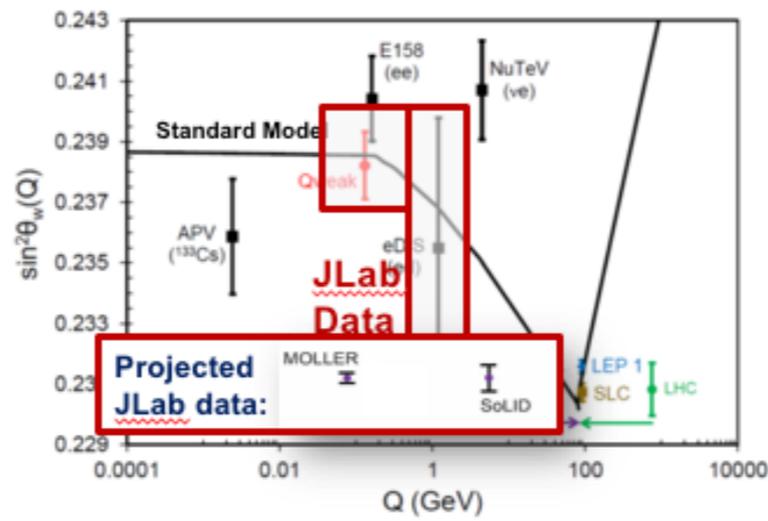

Present & future

- Solenoidal Large Intensity Device – new multipurpose detector facility optimized for high luminosity and large acceptance, enabling very broad scientific program
- Unique capability combining high luminosity (10^{37-39} / cm^2/s) (more than 1000 times the EIC) and large acceptance, with full ϕ coverage to maximize the science return of the 12-GeV CEBAF upgrade

- Unique discovery space for new physics up to 38 TeV mass scale, with a purely leptonic probe
- CD-I approved Dec 2020
- Expected to operate in FY26

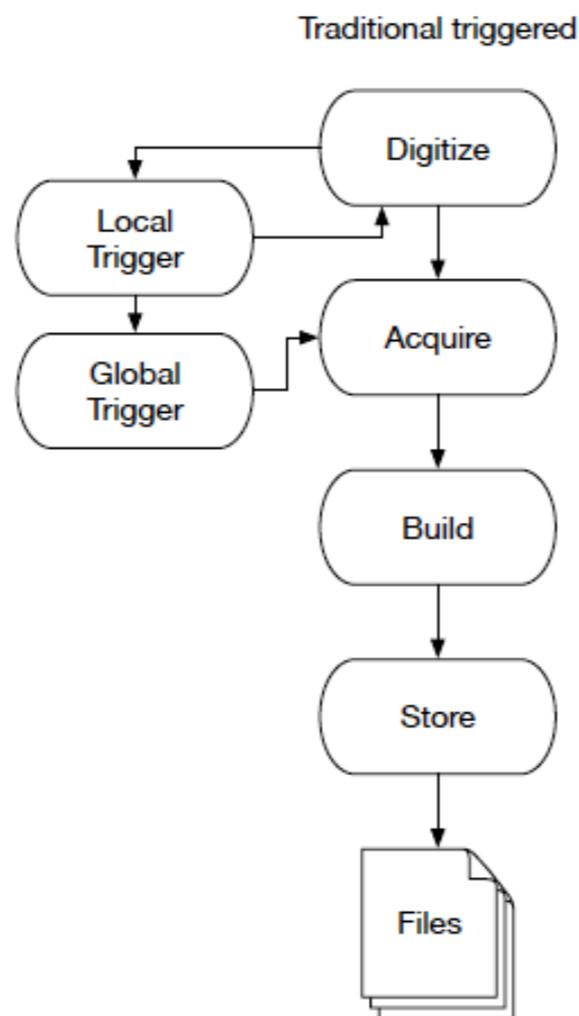

- Luminosity 100-1000 times that of HERA
- Polarized protons and light nuclear beams
- Nuclear beams of all A ($p \rightarrow U$)
- Center mass variability with minimal loss of luminosity
 - Precise vertexing
 - HRes Tracking
 - Excellent PID
- Large acceptance
- Frwrd/Bckw angles

Streaming RO

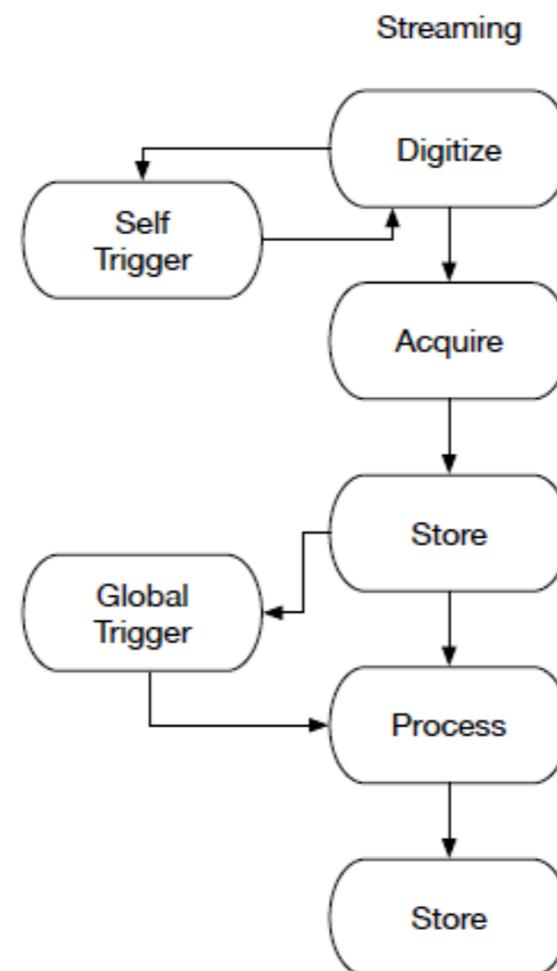

Traditional (triggered) DAQ

- * All channels continuously measured and hits stored in short term memory by the FEE
- * Channels participating to the trigger send (partial) information to the trigger logic
- * Trigger logic takes time to decide and if the trigger condition is satisfied:
 - a new 'event' is defined
 - trigger signal back to the FEE
 - data read from memory and stored on tape
- * **Drawbacks:**
 - only few information from the trigger
 - Trigger logic (FPGA) difficult to implement and debug
 - not easy to change and adapt to different conditions

Streaming readout

- * All channels continuously measured and hits streamed to a HIT manager (minimal local processing) with a time-stamp
- * A HIT MANAGER receives hits from FEE, order them and ship to the software defined trigger
- * Software defined trigger re-aligns in time the whole detector hits applying a selection algorithm to the time-slice
 - the concept of 'event' is lost
 - time-stamp is provided by a synchronous common clock distributed to each FEE
- * **Advantages:**
 - Trigger decision based on high level reconstructed information
 - easy to implement and debug sophisticated algorithms
 - high-level programming languages
 - scalability

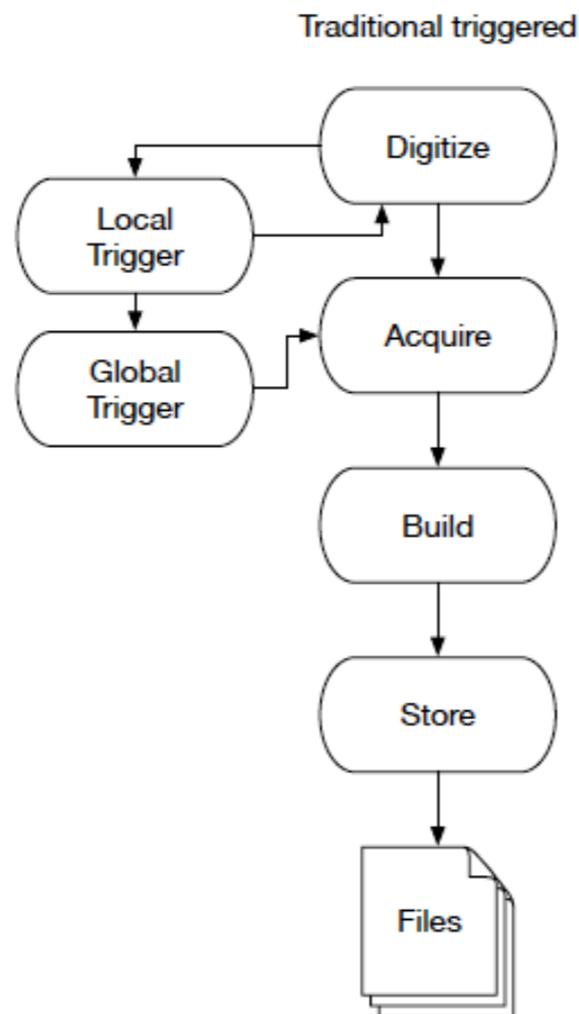

M.Battaglieri - JLAB

M.Battaglieri - JLAB

We know it works!

We need to prove that it works!

Why SRO is so important???

* To cope with high luminosity experiments

- Current experiments are limited in DAQ bandwidth
- Reduce stored data size in a smart way (reducing time for off-line processing)

* Shifting data tagging/filtering from the front-end (hw) to the back-end (sw)

- Optimize real-time rare/exclusive channels selection
- Use of high level programming languages
- Use of existing/ad-hoc CPU/GPU farms
- Use of available AI/ML tools
- (future) use of quantum-computing

* Scaling

- Easier to add new detectors in the DAQ pipeline
- Easier to scale
- Easier to upgrade

Many NP and HEP experiments adopt the SRO scheme (with different solutions):

- CERN: LHCb, ALICE, AMBER
- FAIR: CBM
- DESY: TPEX
- BNL: sPHENIX, STAR, EIC
- JLAB: SOLID, BDX, CLAS12, ...

SRO for EIC

A Streaming Read-Out scheme for EIC requires:

- to identify and quantify relevant streaming-readout parameters
- to be implemented in realistic study cases
- to compare performances with traditional DAQ
- to evaluate the impact on EIC detector design

- 2 ws per year, (last: SRO VII was in April 2021)
- Ideal avenue to exchange ideas, progress across project.
- Contact with commercial enterprises: what is in the pipeline? What should be in the pipeline?
- Monthly phone conf. <https://indico.mit.edu/category/1>)
- Mailing list: eic_streaming_readout@mit.edu
- Not aligned with a particular proposal, and many non-EIC participants

EIC R&D Streaming Readout Consortium eRD23

Abstract

The detectors foreseen for the future Electron-Ion Collider will be some of the few major collider detectors to be built from scratch in the 21st century. A truly modern EIC detector design must be complemented with an integrated, 21st century readout scheme that supports the scientific opportunities of the machine, improves time-to-analysis, and maximizes the scientific output. A fully streaming readout (SRO)

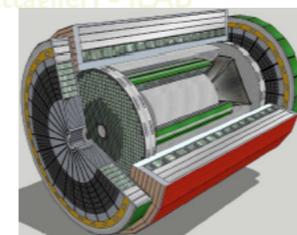

14.6 Data Acquisition

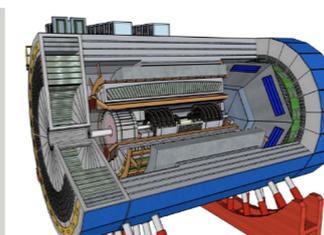

14.6.1 Streaming-Capable Front-End Electronics, Data Aggregation, and Timing Distribution

A streaming readout is the likely readout paradigm for the EIC, as it allows easy scaling to the requirements of EIC, enables recording more physics more efficiently, and allows better online monitoring capabilities. The EIC detectors will likely be highly segmented,

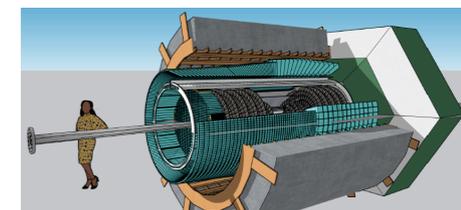

ECCE

ATHENA

CORE

Some examples ...

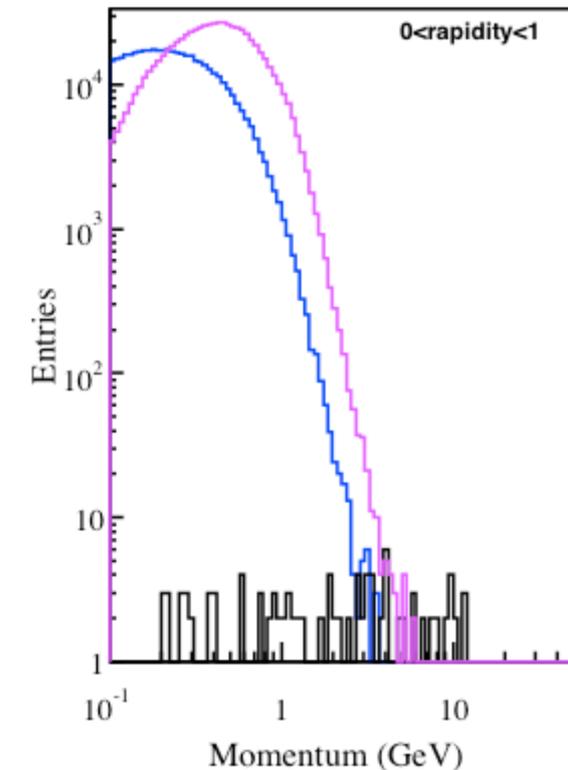

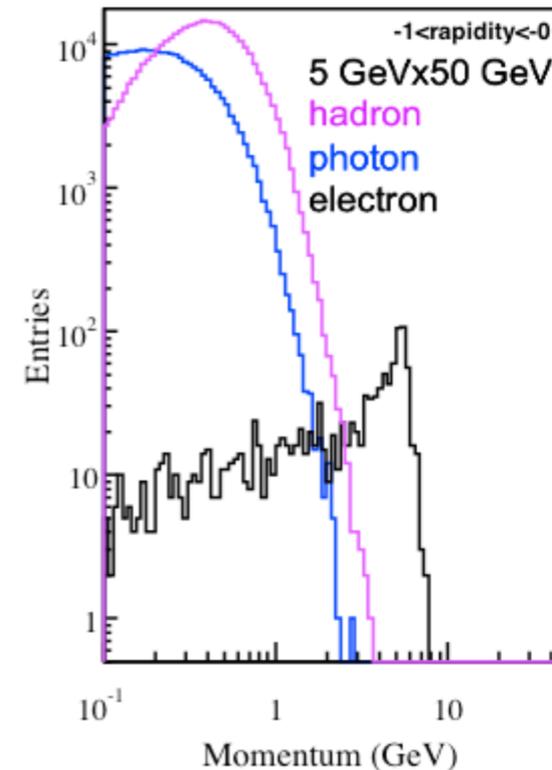

Streaming readout for EIC

A triggerless DAQ provides advantages for all EIC reaction channels

Inclusive channel

- Excellent e/h and e/γ discrimination
- At large η (large Q^2), low-momentum electrons are overwhelmed by hadrons background

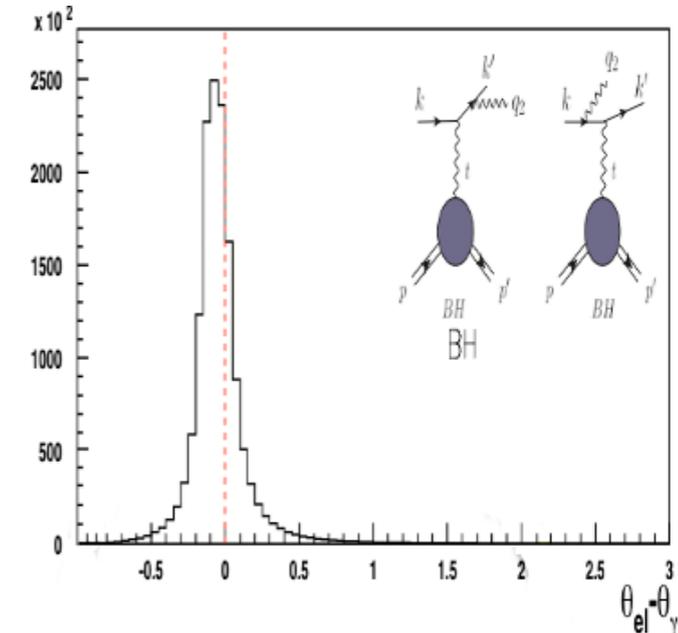

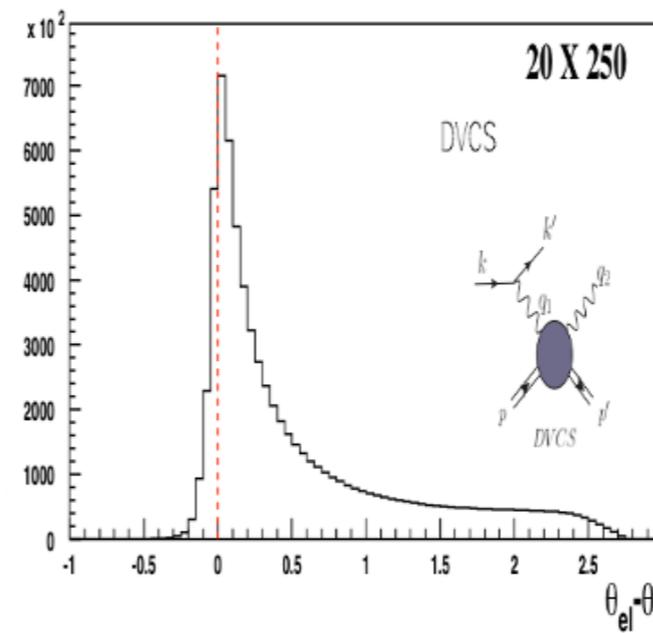

Triggerless DAQ system allows a sophisticated electron selection, making use of advanced algorithms applied to the full information from detectors

Exclusive channels

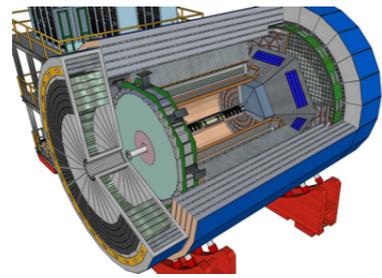

Several trigger conditions tailored to physics
Eg. DVCS

- DVCS benefits by the measurement of the hard photon together with the scattered electron
- The dominant BH background can be rejected by reconstructing θ_e and θ_γ and cutting on $(\theta_e - \theta_\gamma)$

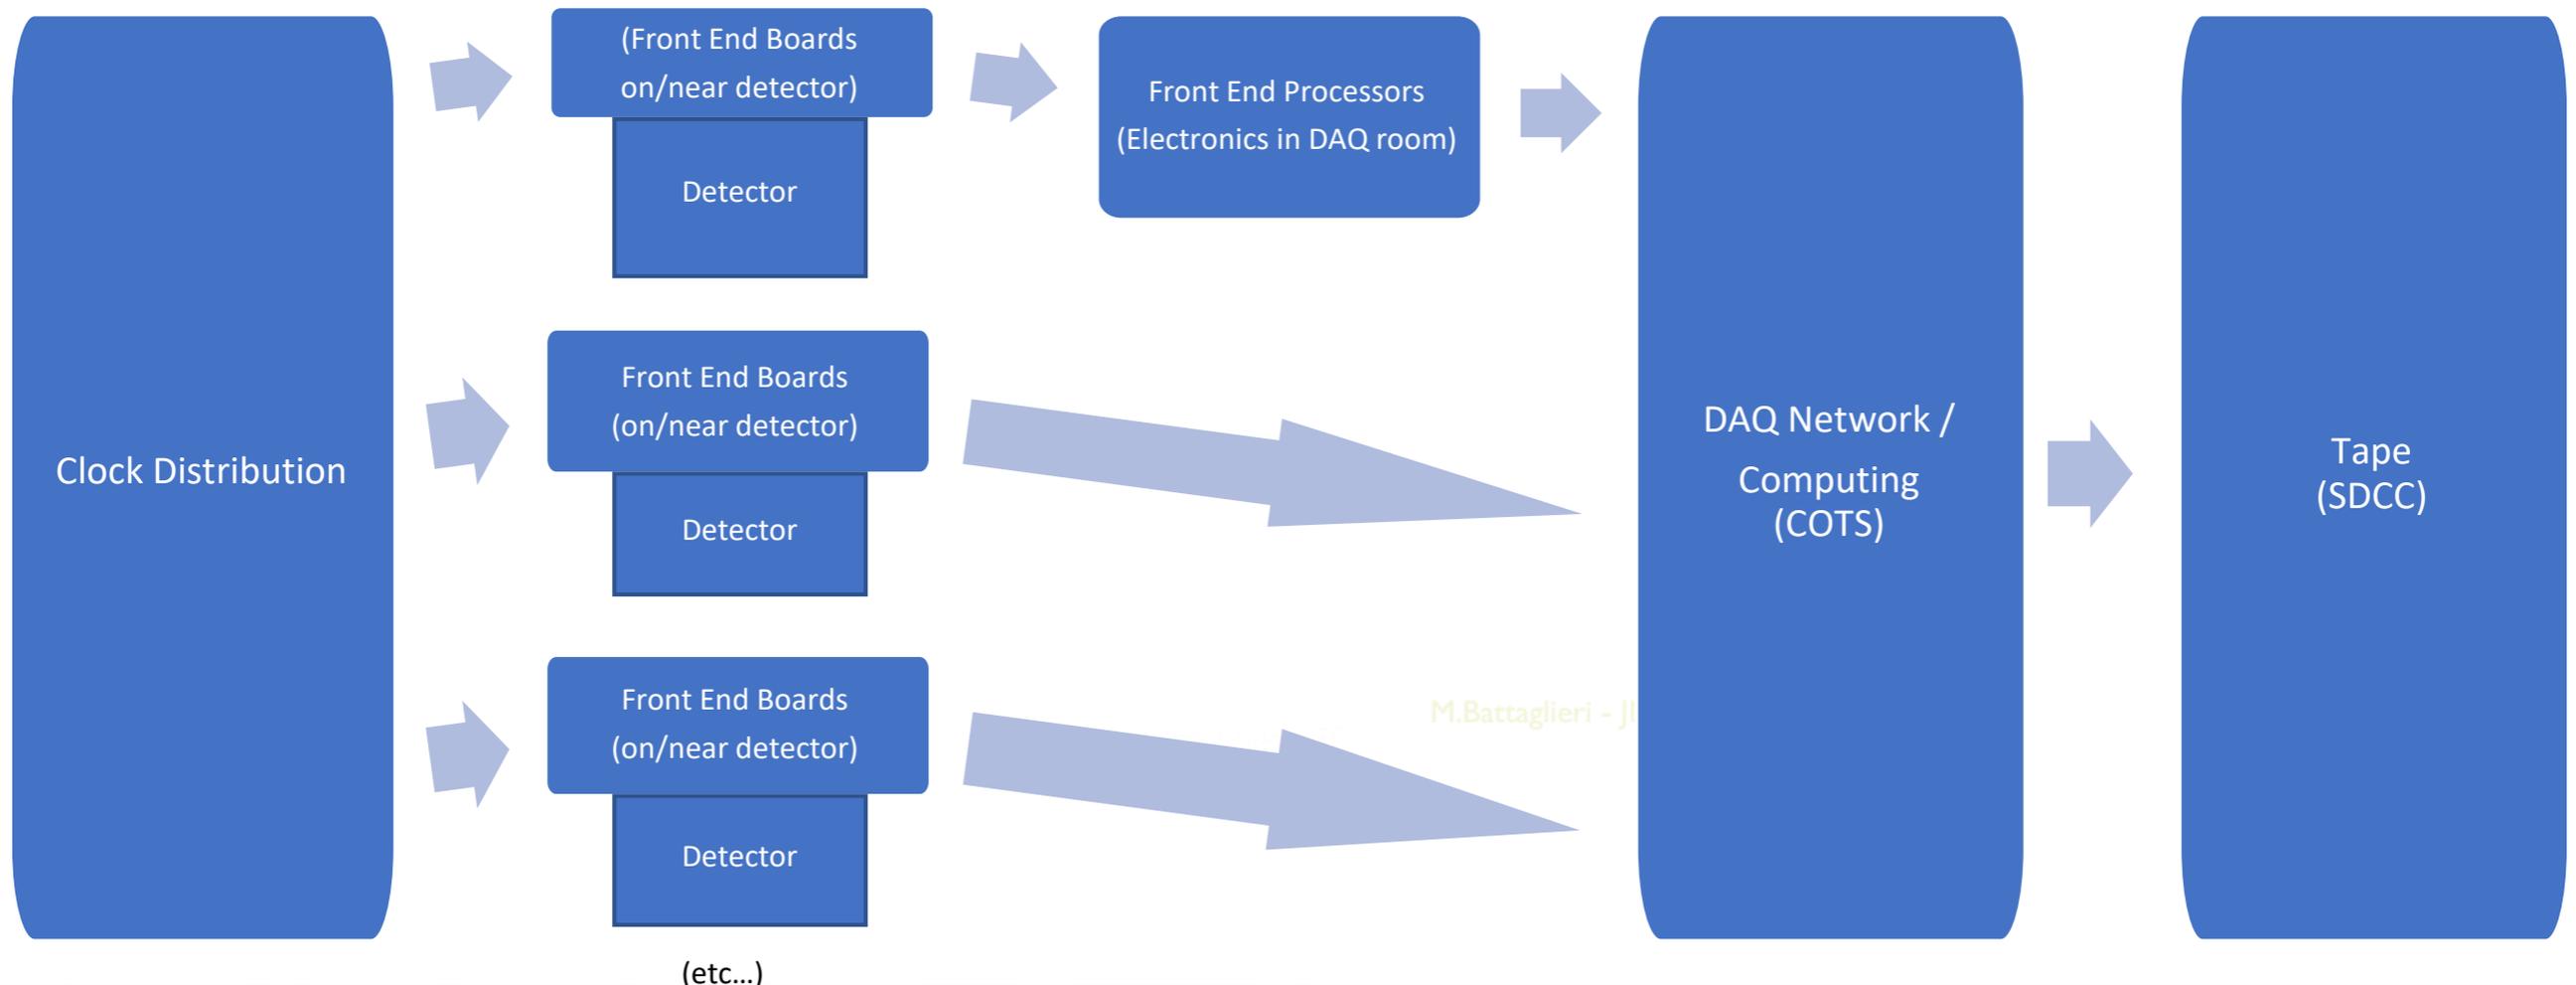

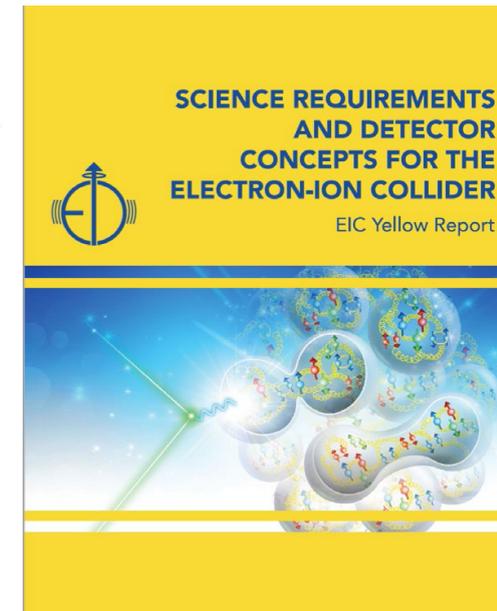

Large flexibility to add new triggers for different physics cases!

Some examples ...

We envision a triggerless streaming DAQ system following the outline described in the Yellow Report

- Gets rid of many latency constraints
- Gets rid of the need for a hardware trigger
- Amplifies the need for robust zero-suppression / data compression
- No trigger allows for any physics process studies off-line

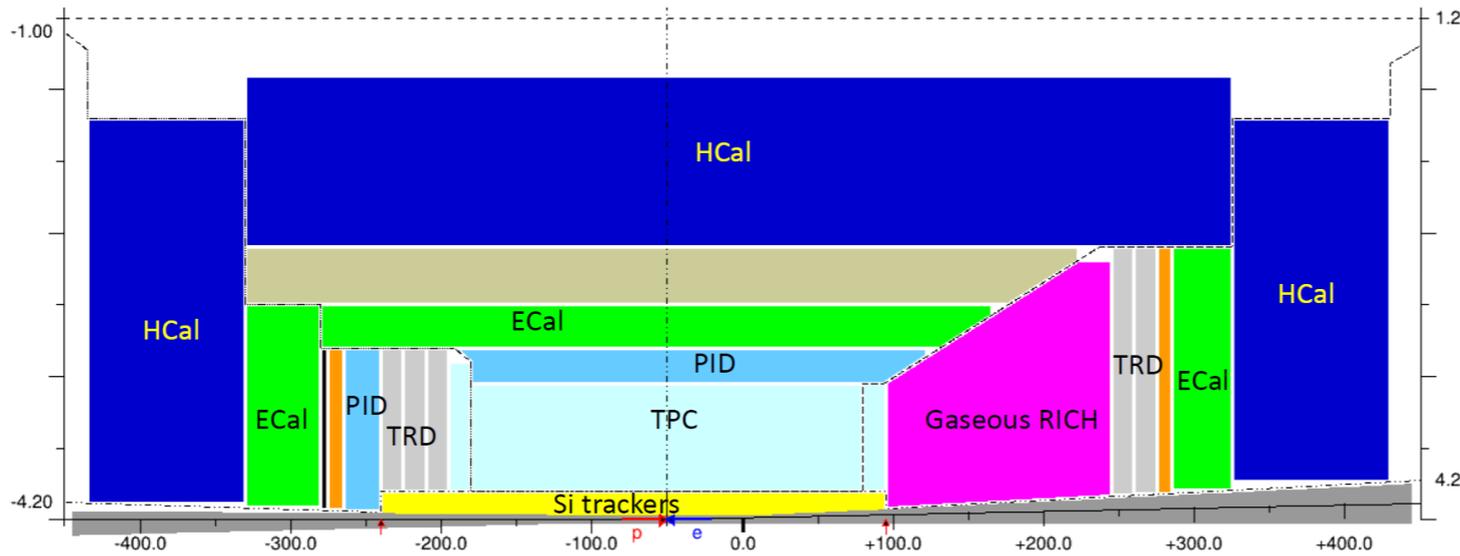

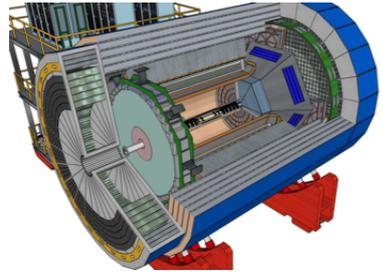

M.Battaglieri - JLAB

(etc...)

Some examples ...

Alexandre Camsonne, Jeffery Landgraf

- ▶ Tracking: GEM + MPGD
- ▶ eCal-FW: PBWO + W_{powder} sci/fi, SiFi
- ▶ eCal-BR: SiFi
- ▶ hCal: Fe/Sci
- ▶ pId: mRICH, DIRC, DRICH
- ▶ pId: TOF LGAD
- ▶ FarFW: ZDC, RomanPot

- ▶ Collider parameters:
 - ~500KHz of collisions
 - ~60-100Gbps zero suppressed data
 - ~15 KB/event
 - ~100 bytes/bunch crossing
- ▶ Significant number of channels
- ▶ Challenging data compression scheme
 - Noise reduction
 - Zero suppression
 - Background elimination
- ▶ Keeping option of data selection before going to tape in case data volume too large to record all the streams

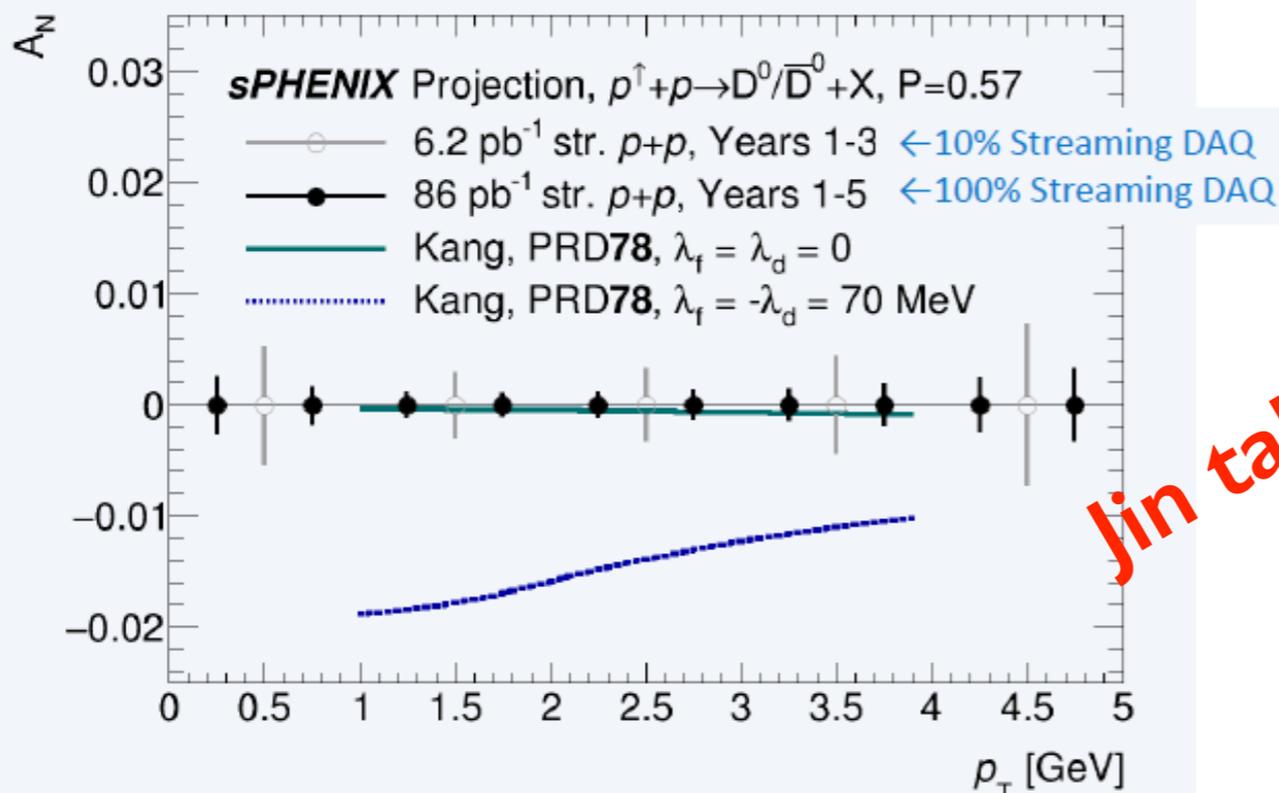

Detector	Readout Technology	Channel Count
Silicon Tracking	Si MAPS	37B
GEM/MMG Layer	GEM	217K
Cylindrical MPGD *	GEM	60M
HP-DIRC	MAP/MT	100-330k
ECAL	SiPM	1.7K
HCAL	SiPM	24K
HCAL imaging	Si MAPS	480M
dRICH	PMT/SiPM	350K
mRICH	PMT/SiPM	330K
B0	Si MAPS	32M + 320K
Off-Momentum	AC-LGAD (eRD24)	750K
Roman Pots	AC-LGAD (eRD24)	500K
ZDC	LGAD + ASIC eRD27	225+366
TOF	AC-LGAD	15M

Streaming readout for sPHENIX

Streaming-DAQ enabled scientific connection: Example: gluon dynamics via heavy flavor A_N

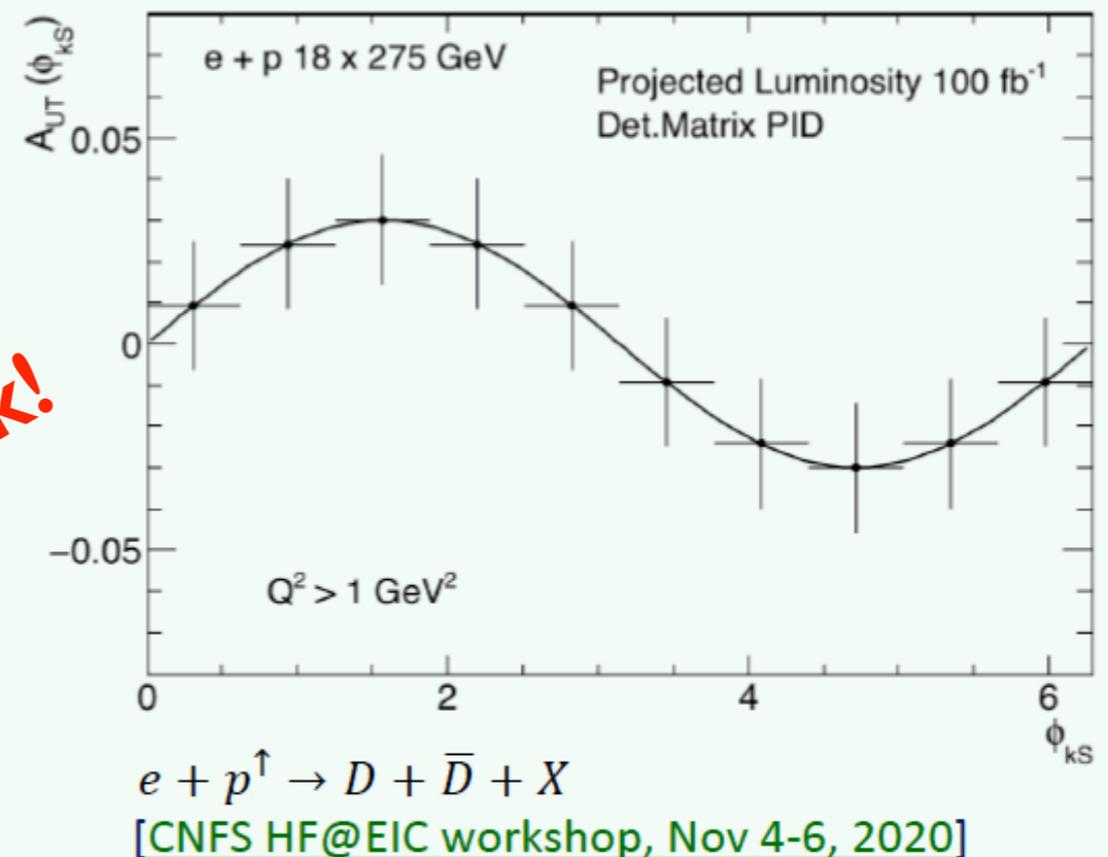

← Universality test on gluon Sievers →

sPHENIX D^0 trans. spin asymmetry, $A_N \rightarrow$ Gluon Sievers via tri- g cor. EIC SIDIS D^0 transverse spin asymmetry \rightarrow Gluon Sievers

Software & Computing Round Table

Streaming RO @ JLab

Streaming Read Out (RO) is one of the milestones of JLab Agenda

* Streaming RO is necessary for a long-term HI-LUMI upgrade of CLAS12

- Running CLAS12 at higher luminosity (wrt the designed $10^{35}\text{cm}^{-2}\text{ s}^{-1}$) has been declared as a milestone for the FY21 JLab Agenda
- The appointed PhysDiv Task Force (S.Stepanyan) identified a staged approach with an increase of 2x (keeping $\epsilon_{\text{Rec}} > 85\%$) in 2-3 years (Phase I) timeframe and a 100x in 5-7 years (Phase II)
- An update of the RI CLAS12 DC with more dense detector (e.g. GEM) is expected in Phase I. A Streaming RO DAQ upgrade is necessary for the Phase II
- With the current triggered technology the maximum possible event acquisition rate for CLAS12 is ~ 100 kHz ($R \sim 30$ kHz now) replacing MM and CAENT TDCs

* Streaming RO can be tested in Hall-D using the PS hodoscope

- Hall-D PS can be used as a beam test facility (fully parasitic) for a tagged electron/positron beam

* Streaming RO is recognised as the leading DAQ technology for the EIC project

- CLAS12 can be used to test and validate detector/DAQ solutions for the EIC in a realistic on-beam condition
- Using VTP readout CLAS12 can reuse 3/4 of existing triggered boards (fADC250) in streaming mode
- Part of a lab-wide effort (involving Hall-C and Hall-D) to test EIC calorimetry

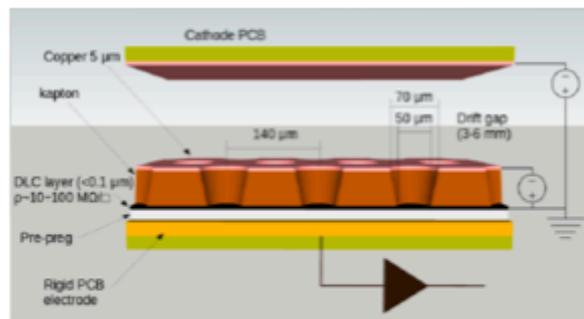

Unique opportunity of testing solutions in real (on-beam) conditions!

Streaming readout for CLAS12 HI-LUMI

Goal: double the current luminosity to operate CLAS12 at $L \sim 2 \times 10^{35} \text{ cm}^{-2} \text{ s}^{-1}$ within the next 2-3 years

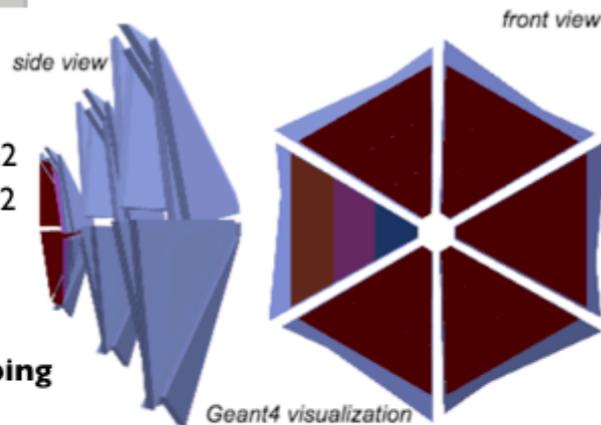

- **CLAS12 High Luminosity operation has been included in the Lab Agenda**
- Hall-B Task Forces (S.Stepanyan and S.Boyarinov)) conclusions: required a 1) new tracking detector & 2) new DAQ

1) New CLAS12 tracking system: μ -Rwell

The μ -RWELL features:

- Compactness
 - Easy assembly
 - Easy powering
 - Intrinsic spark quenching
- Same technology proposed for EIC

The performance

- Gas gain: 10^4
- Rate capability HR version: 10 MHz/cm²
- Rate capability LR version: 100 kHz/cm²
- Spatial resolution: down to 60 μm
- Time resolution: 5-6 ns

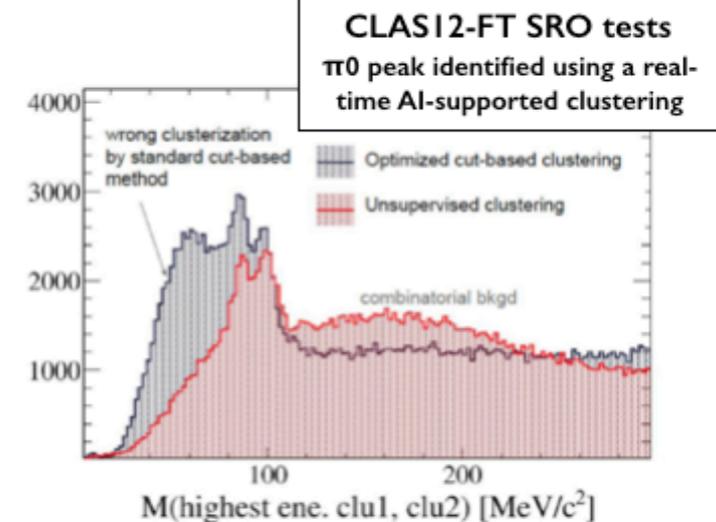

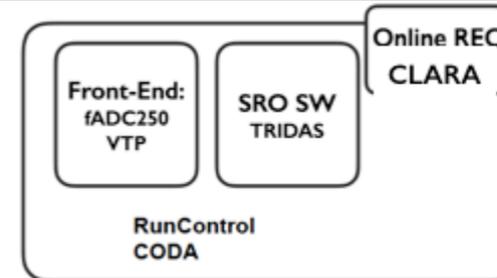

Status: CLAS12 μ -RWELL prototyping

- a prototype is being built by UVA
- full implementation in GEMC/REC software

2) New CLAS12 Streaming Readout (SRO) DAQ

- current 'triggered' CLAS12 DAQ limited to 50 kHz acquisition rate
- working on a full streaming mode with 100kHz bandwidth
- Use of the current FE electronics (fADC250,VTP) and new backend software (TRIDAS)
- On-beam tests with CLAS12- FT are promising

Streaming RO CLAS12 FT tests: triggerless DAQ chain

Options for μ -RWELL readout

- under test: SAMPA (ALICE), VMM3 (ATLAS) and FATIC2 LHCb)

M. Battaglieri - JLAB

Back to present: the CLAS12 detector

Forward Detector:

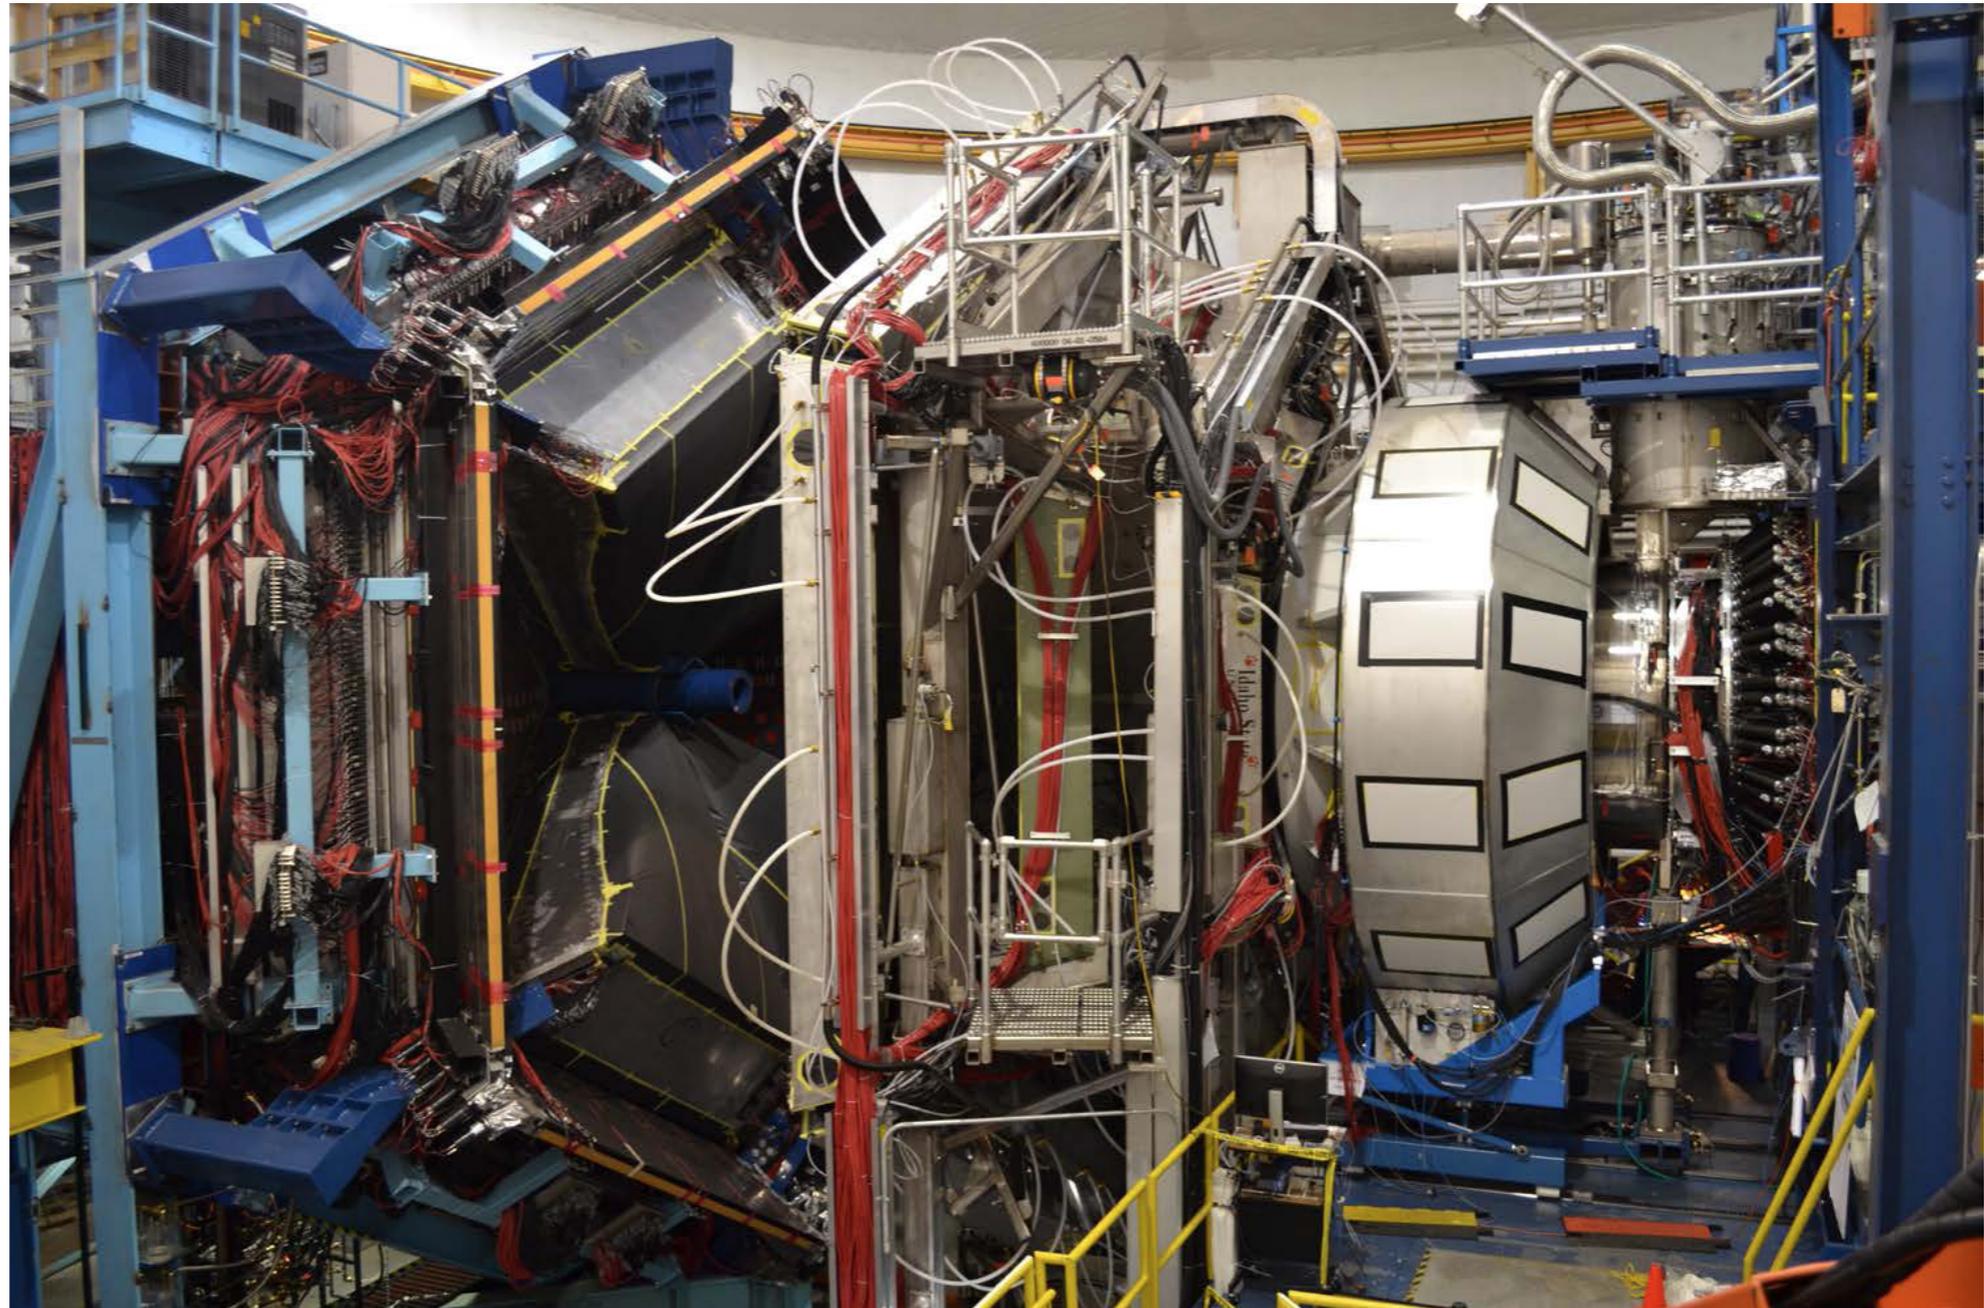

- TORUS magnet
- HT Cherenkov Counter
- Drift chamber system
- LT Cherenkov Counter
- Forward ToF System
- Preshower calorimeter
- E.M. calorimeter (EC)

Central Detector:

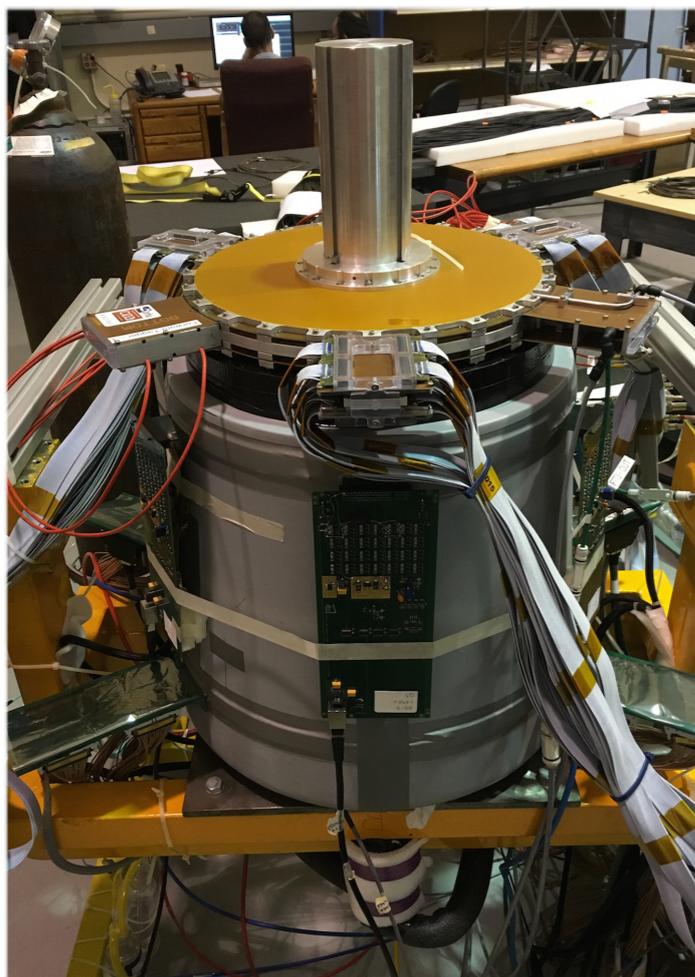

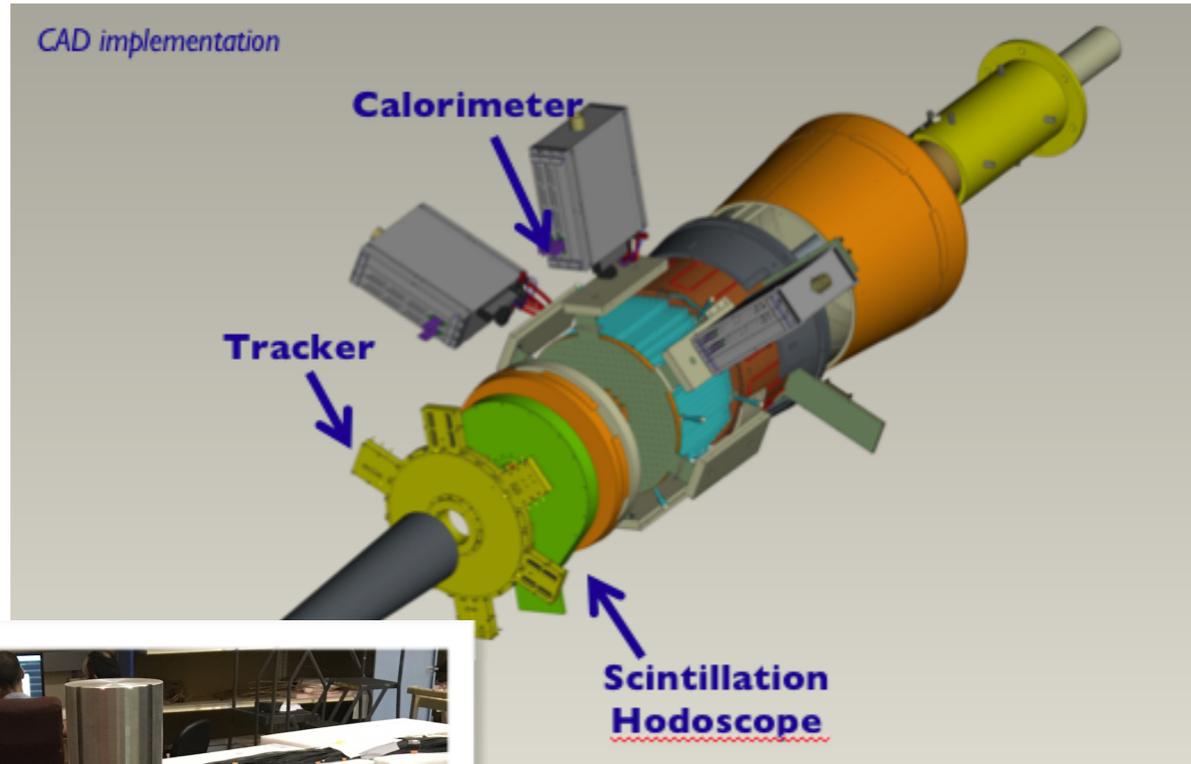

- SOLENOID magnet
- Barrel Silicon Tracker
- Central Time-of-Flight

Upgrades:

- Micromegas (CD)
- Neutron detector (CD)
- RICH detector (FD)
- Forward Tagger (FD)

CLAS12 and the Forward Tagger (FT)

FT-Trck: MicroMegas

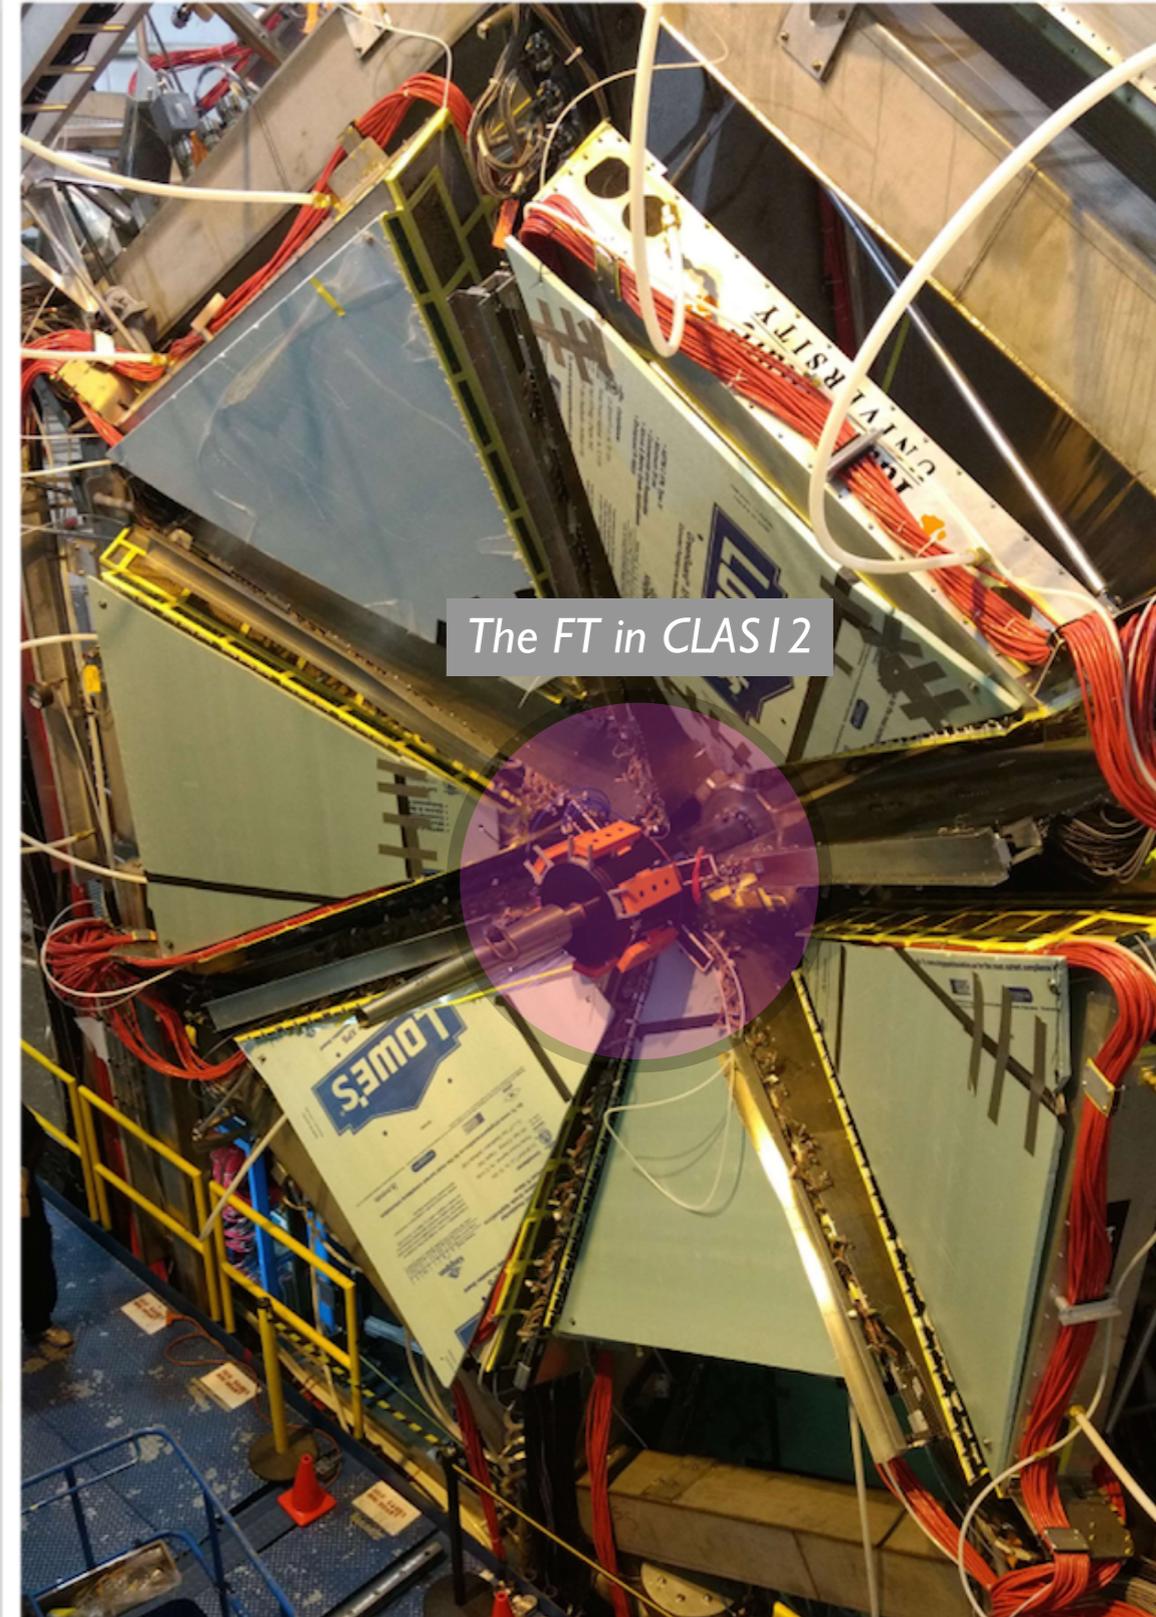

- electron angles and polarization plane

FT-Hodo: Scintillator tiles

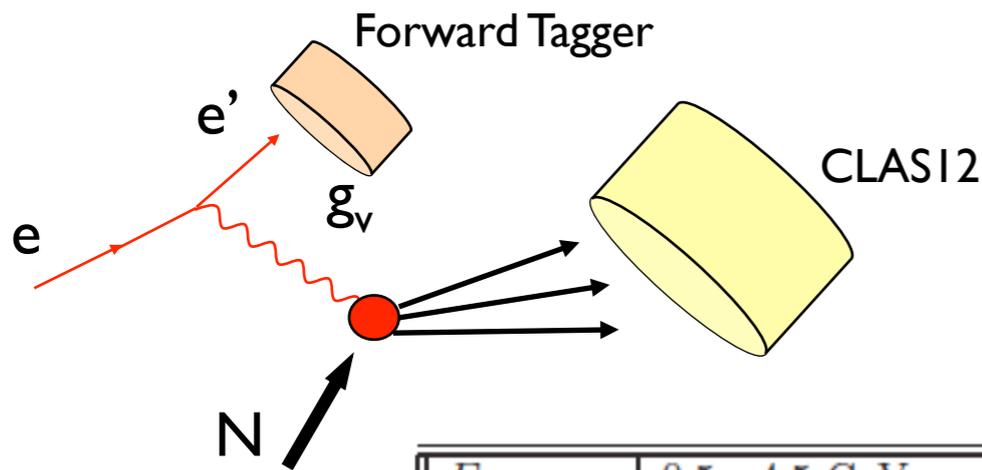

- veto for photons

FT-Cal: PbWO₄ calorimeter

- electron energy/momentum
- Photon energy ($\nu = E - E'$)
- Polarization $\epsilon^{-1} \approx 1 + \nu^2/2EE'$

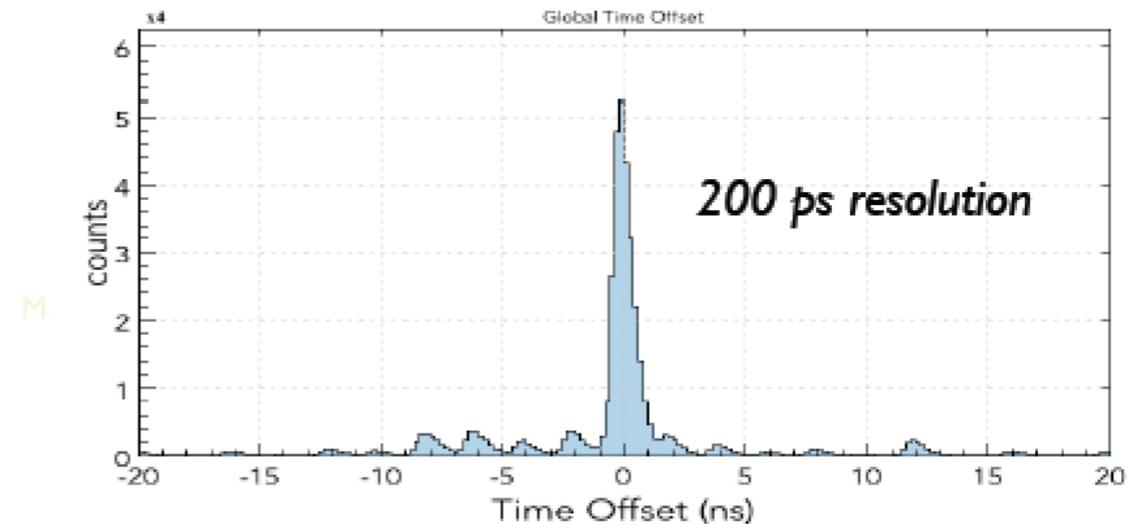

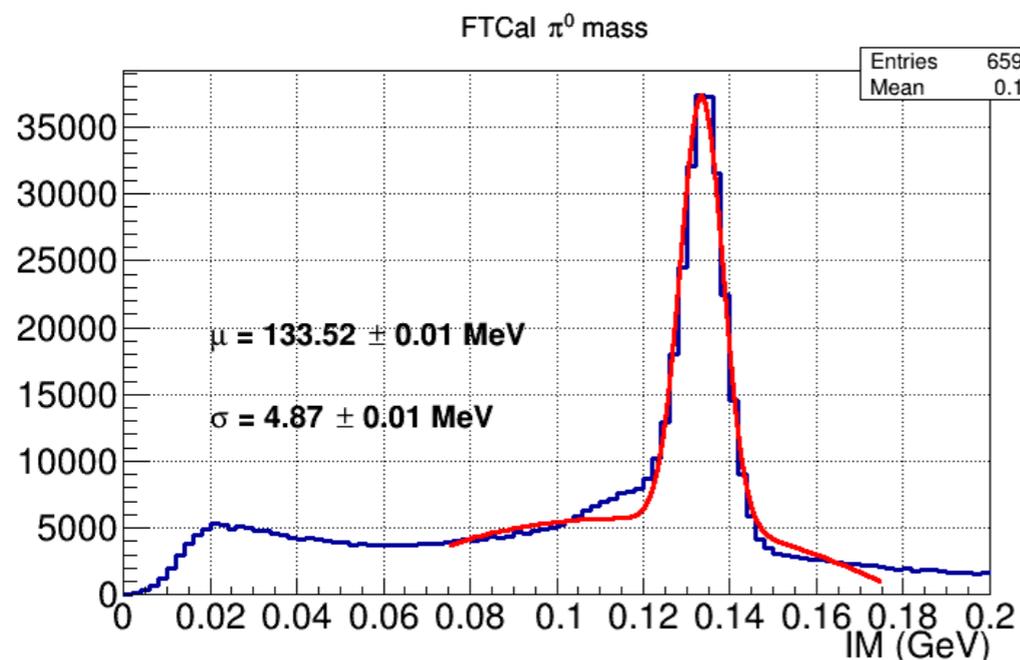

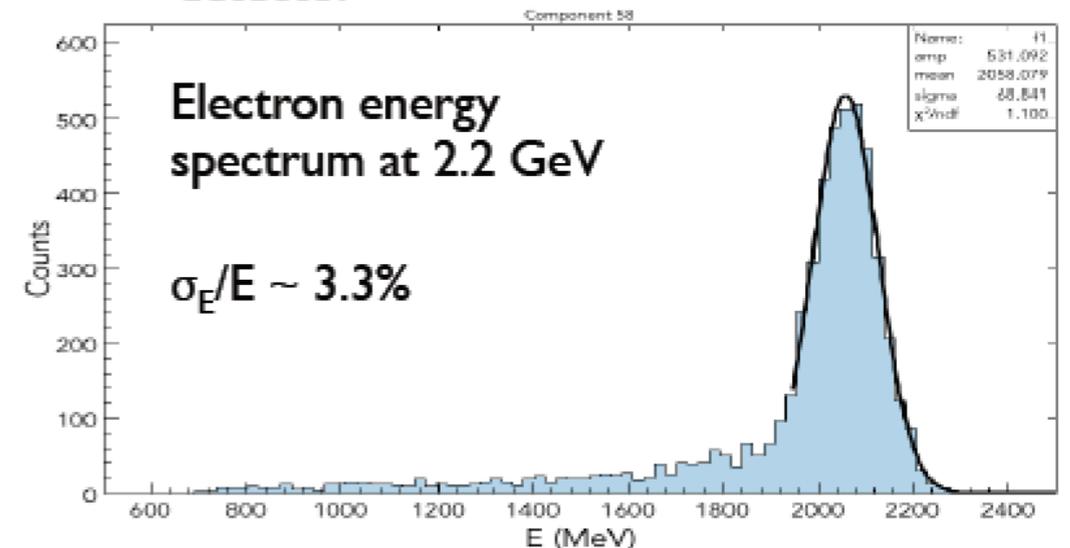

FT performance

$E_{scattered}$	0.5 - 4.5 GeV
θ	$2.5^\circ - 4.5^\circ$
ϕ	$0^\circ - 360^\circ$
ν	6.5 - 10.5 GeV
Q^2	0.01 - 0.3 GeV^2 ($\langle Q^2 \rangle > 0.1 \text{ GeV}^2$)
W	3.6 - 4.5 GeV

Final calorimeter calibration based on real data:

- Energy calibration based on elastic data at 2.2 GeV and 6.4 GeV
- Timing calibration based on coincidence with forward CLAS12 detector

Streaming RO - CLAS12-FT tests

- SRO DAQ full chain test: FE + RunControl + Streaming ROsw + Rec
- On-beam tests
 - Run1: 10.4 GeV electron beam on Pb target in Jan/Feb 2020
 - Run2: 10.4 GeV electron beam on H2 and D2 targets in Aug/Sept 2020
- Hall-B CLAS12 Forward Tagger: Calorimeter + Hodoscope + (Tracker)

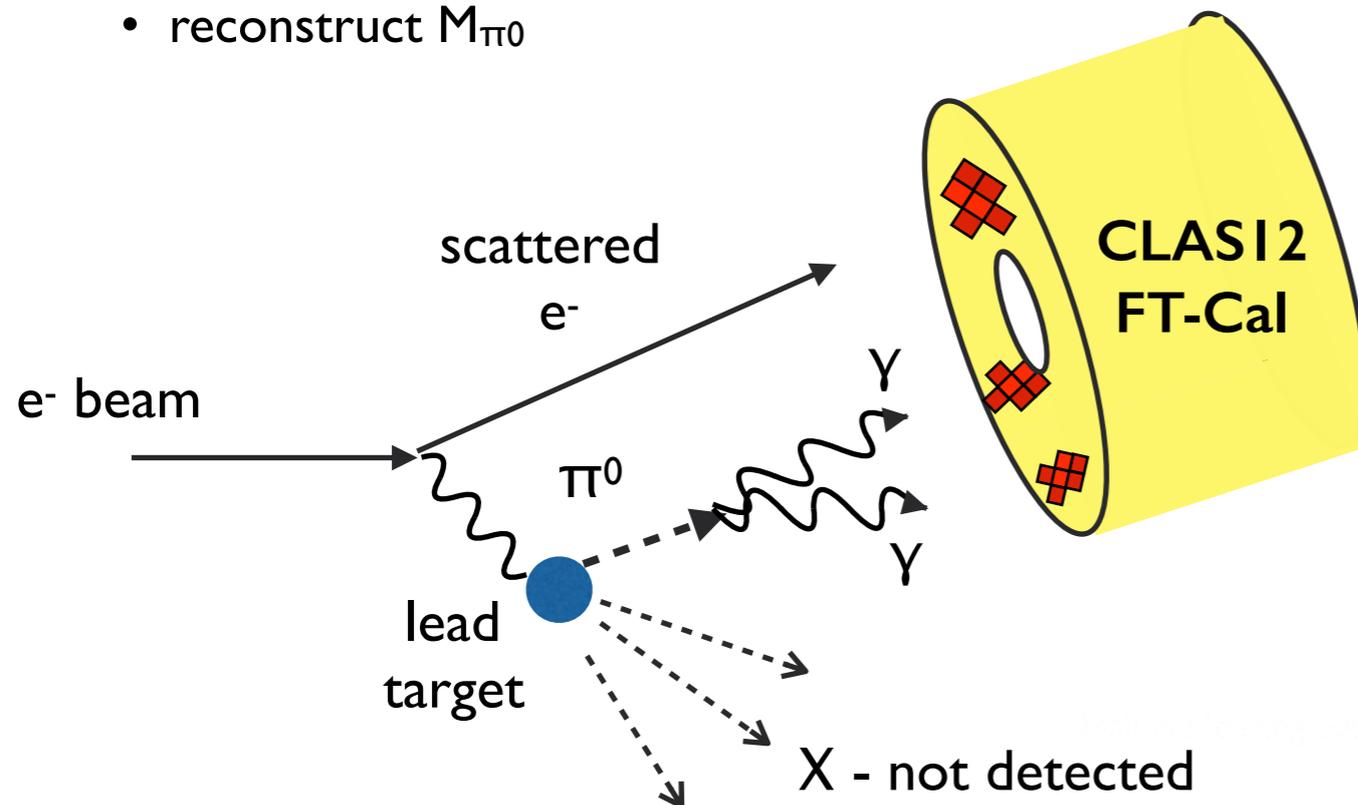

Goal:

- collect data with 1-2-3 clusters in FT-CAL
- Identify the reaction

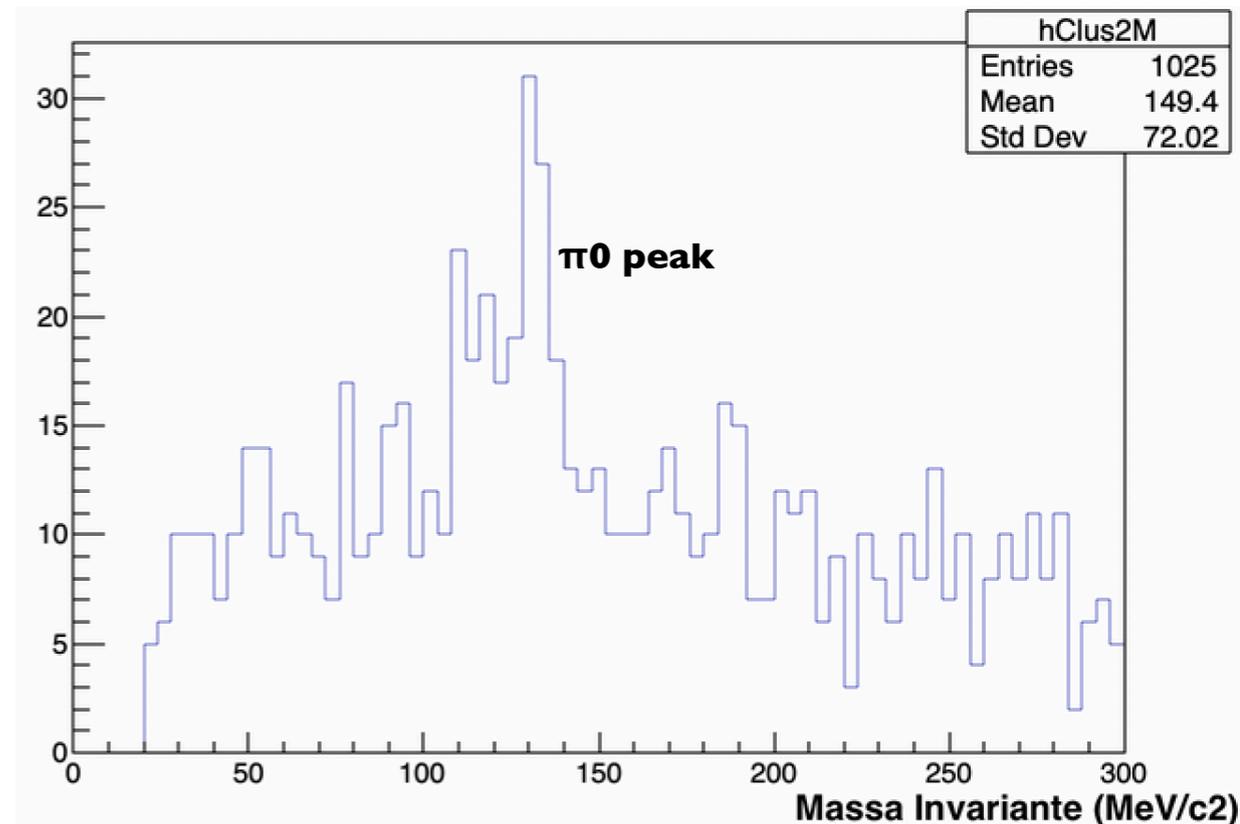

$$e \text{ H/D2/Al/Pb} \rightarrow (X) e' \pi^0 \rightarrow (X) e' \gamma \gamma$$
- reconstruct M_{π^0}

Test equipment

- FT-Cal: 332 PbWO crystals (APD)
- 10+12 fADC250 boards + 2 VTPs (in 2 crates/ROCs)
- FT-Hodo: 232 plastic scintillator tiles (SiPM)
- 15 fADC250 boards

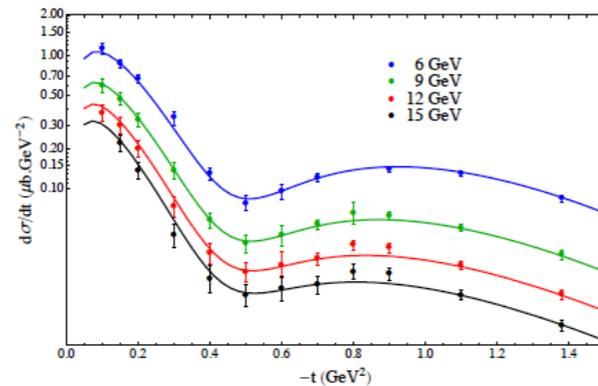

double-clusters (π^0) mass obtained from FT-Cal RG-A data fed to TRIDAS

Realistic inclusive π^0 photoproduction model

- ▶ Multi π^0 detection suppressed by FT acceptance
- ▶ Physics model of π^0 real photoproduction from JPAC (arXiv:1505.02321)
- ▶ Electroproduction simulated as quasi-real ph.prod. as in Tsai
- ▶ $2 < k_\gamma < 10$ GeV
- ▶ Acceptance $2^\circ < \theta_{\pi^0} < 6^\circ$, quite larger than the real one;
- ▶ Real acceptance (different for each target) from GEANT
- ▶ Other cuts from GEANT

Contributions considered

- ▶ Internal in Lead
 - ▶ Real (brehemstrahlung)
 - ▶ Virtual (electroproduction)
- ▶ Internal in Alluminum
 - ▶ Real (brehemstrahlung)
 - ▶ Virtual (electroproduction)
- ▶ Real photons radiated from Pb, target Al

Internal production (Tsai 4.16, 4.24):

$$\frac{1}{\log E_{\text{beam}}/k_{\text{min}}} \int_{k_{\text{min}}}^{E_{\text{beam}}} \sigma(k)_{4\pi} \frac{dk}{k} = 0.924 \mu\text{b}$$

$$\frac{1}{\log E_{\text{beam}}/k_{\text{min}}} \int_{k_{\text{min}}}^{E_{\text{beam}}} \sigma(k)_{\text{FT}} \frac{dk}{k} = 0.182 \mu\text{b}$$

Radiated from Pb:

$$\left[\int_{k_{\text{min}}}^{E_b} f(k) dk \right]^{-1} \int_{k_{\text{min}}}^{E_b} \sigma(k)_{4\pi} f(k) dk = 0.964 \mu\text{b}$$

$$\left[\int_{k_{\text{min}}}^{E_b} f(k) dk \right]^{-1} \int_{k_{\text{min}}}^{E_b} \sigma(k)_{\text{FT}} f(k) dk = 0.177 \mu\text{b}$$

with $f(k) = \left[\frac{4}{3} \left(\frac{1}{k} - \frac{1}{E_b} \right) + \frac{k}{E_b^2} \right]$ (Tsai 3.84)

- ▶ Internal in Lead
 - ▶ Real $N_e \frac{N_A X_{\text{Pb0}}}{A} \frac{T_{\text{Pb}}^2}{2} \log \frac{E_{\text{beam}}}{k_{\text{min}}} = 2.84 \times 10^5 \mu\text{b}^{-1}$
 - ▶ Virtual $N_e \frac{N_A X_0}{A} T_{\text{Pb}} t_{\text{eq}} \log \frac{E_{\text{beam}}}{k_{\text{min}}} = 4.33 \times 10^5 \mu\text{b}^{-1}$
- ▶ Internal in Alluminum
 - ▶ Real 1: $N_e \frac{N_A X_{\text{Al0}}}{A} \frac{T_{\text{Al1}}^2}{2} \log \frac{E_{\text{beam}}}{k_{\text{min}}} = 244 \mu\text{b}^{-1}$
 - ▶ Real 2: $N_e \frac{N_A X_{\text{Al0}}}{A} \frac{T_{\text{Al2}}^2}{2} \log \frac{E_{\text{beam}}}{k_{\text{min}}} = 680 \mu\text{b}^{-1}$
 - ▶ Virtual 1: $N_e \frac{N_A X_{\text{Al0}}}{A} T_{\text{Al1}} t_{\text{eq}} \log \frac{E_{\text{beam}}}{k_{\text{min}}} = 2.47 \times 10^4 \mu\text{b}^{-1}$
 - ▶ Virtual 2: $N_e \frac{N_A X_{\text{Al0}}}{A} T_{\text{Al2}} t_{\text{eq}} \log \frac{E_{\text{beam}}}{k_{\text{min}}} = 4.11 \times 10^4 \mu\text{b}^{-1}$
- ▶ Real photons radiated from Pb, target Al
 - ▶ $N_e \frac{N_A X_{\text{Al0}}}{A} T_{\text{Pb}} T_{\text{Al1}} \left[\int_{k_{\text{min}}}^{E_b} f(k) dk \right] = 3.13 \times 10^4 \mu\text{b}^{-1}$
 - ▶ $N_e \frac{N_A X_{\text{Al0}}}{A} T_{\text{Pb}} T_{\text{Al2}} \left[\int_{k_{\text{min}}}^{E_b} f(k) dk \right] = 5.23 \times 10^4 \mu\text{b}^{-1}$

CLAS12-FT acceptance/efficiency

- ▶ From Lead, $z = -4$ cm, 1.4%
- ▶ From Al1, $z = 25.5 - 4$ cm, $x = 1$ cm, 0.8%

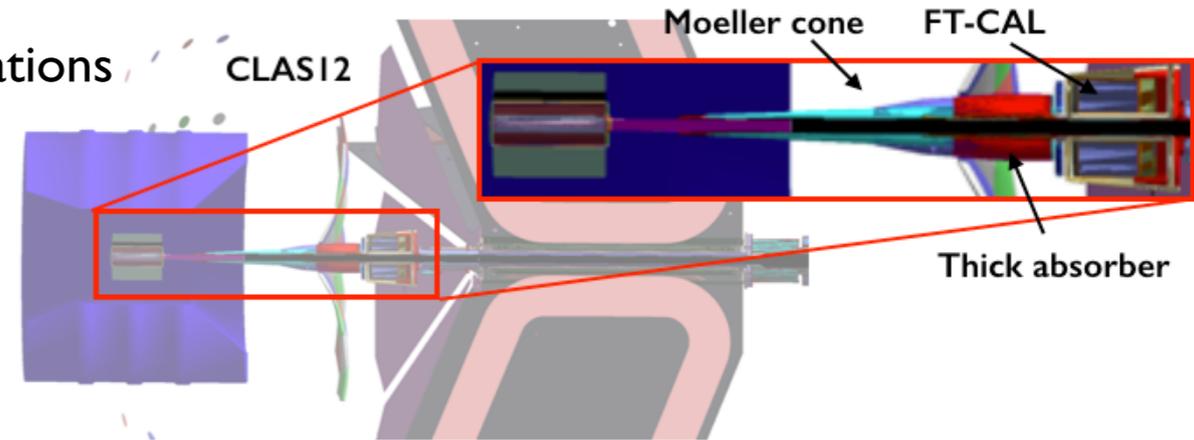

Expected yield (20mn run $L = 1e^{35} \text{ cm}^{-2} \text{ s}^{-1}$)

- ▶ From Lead ~1800
- ▶ From 160 μm Al+glue ~420

Hall-B Tests

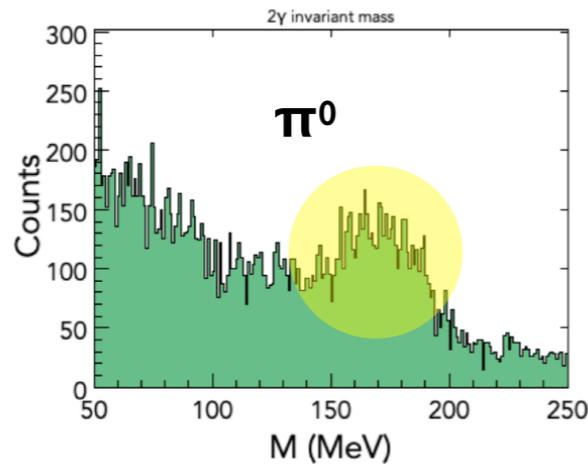

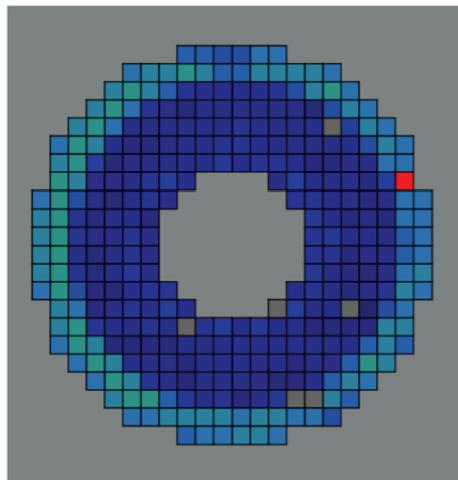

M.Bondí, P.Moran, S.Vallarino

- Full GEANT4 simulations for the different experimental configurations
- Run1: no Moeller cone, nuclear (thin) target
- Run2: Moeller cone, longer target

2-gamma events assuming z=-32cm

D2 target run 12509

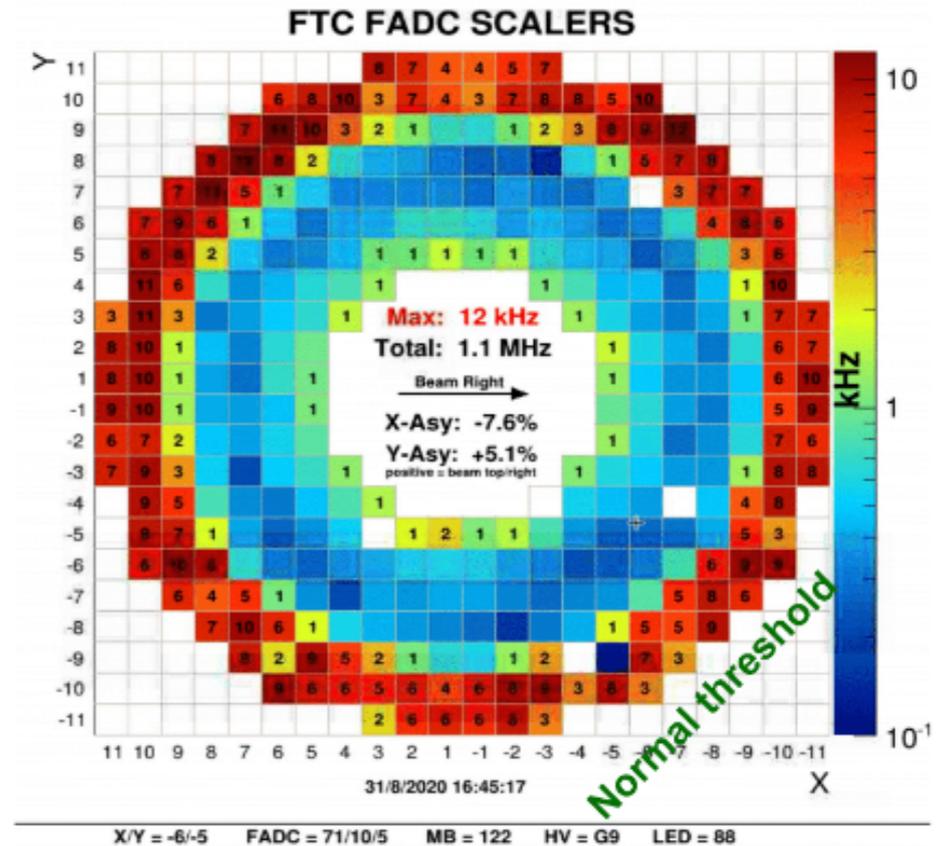

R.De Vita

- As a reference, data taken both in 'triggered' and SRO mode

- On-line scalars during Run2

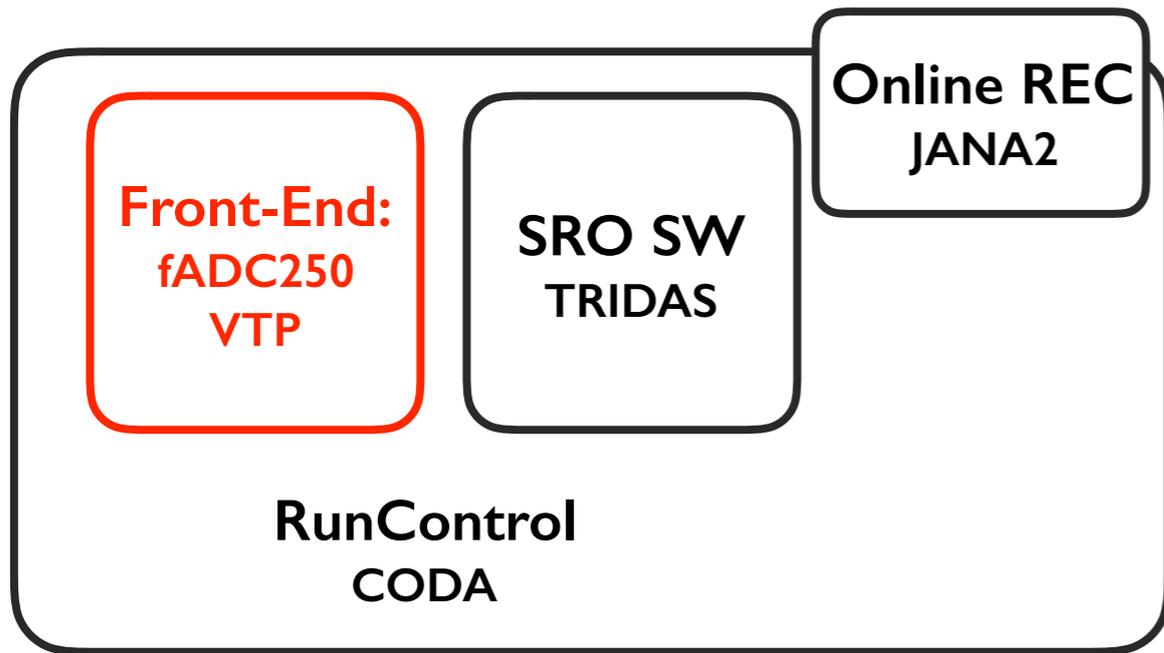

SRO mode:

- L1 "minimum-bias": at least one crystal with energy > 2 GeV
- several L2 conditions in "tagging-mode" and "filtering-mode"
 - "standard" clustering algorithm: at least 2 clusters in FT-CAL
 - cosmic tracking
 - AI clustering algorithm: at least two cluster in the FT-CAL

Goal:

- study SRO performance: memory + cpu use, trigger eff., ...
- Collect data for physics analysis: pi0 production on target
- Demonstrate t SRO s outperforms vs. a triggered DAQ

Streaming RO - CLAS12-FT tests

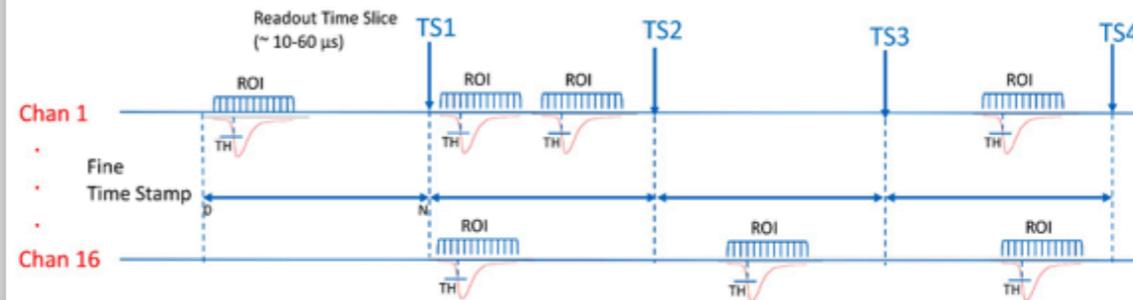

FrontEnd

D.Abbott, F.Ameli, C.Cuevas, P. Musico, B.Raydo

JLAB FADC in "Streaming Mode"

Streaming data can be thought of as Triggered mode where the trigger is a fixed pulser and you keep all the data for a single channel generated from the last pulse.

A 250 MHz FADC generates a 12 bit sample every 4ns. That's 3 Gb/s for one channel. A 16 channel module is 48 Gb/s. That is over twice the available VXS bandwidth. But we don't need ALL the data.

Within the FPGA we keep only the data around a **Region of Interest (ROI)** from each channel, along with a **fine time stamp** in each time slice window.

Depending on hit rates and available bandwidth, We can keep the individual samples or just compute a sum.

Jefferson Lab

Streaming DAQ Through the VXS Trigger Processor

Bypassing '64x Example

- A** 1 SSP manages 32 LC fiber @2.5Gbps
- B** 16 SSP/crate @20Gbps to VTP [4 lanes/@5Gbps]
 - Streaming bandwidth 320Gbps to VTP
 - 40Gbe from VTP "CODA ROC"

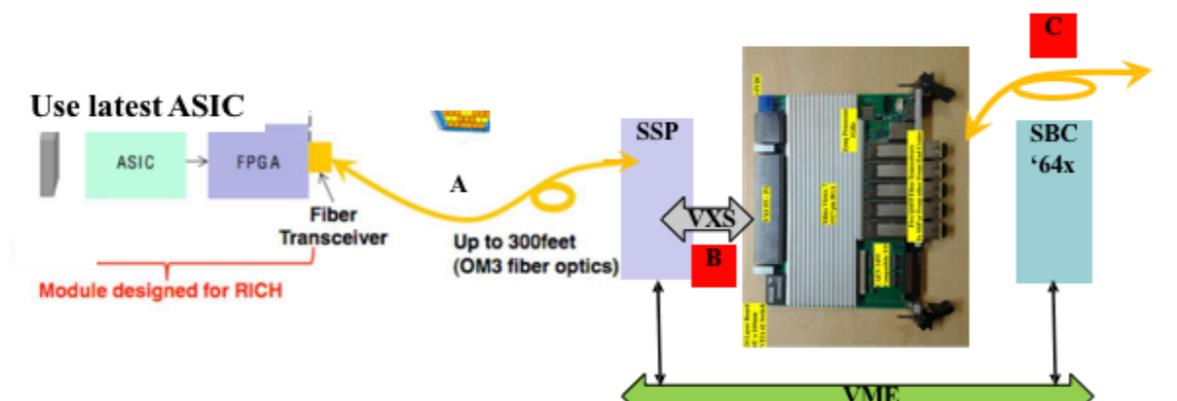

- C** VTP can perform significant data processing 192 channels for FPGA front end so, Single VXS crate could stream $192_{FPGA} * 32_{Links} * 16_{SSP} = 98304$ Chs

During tests:

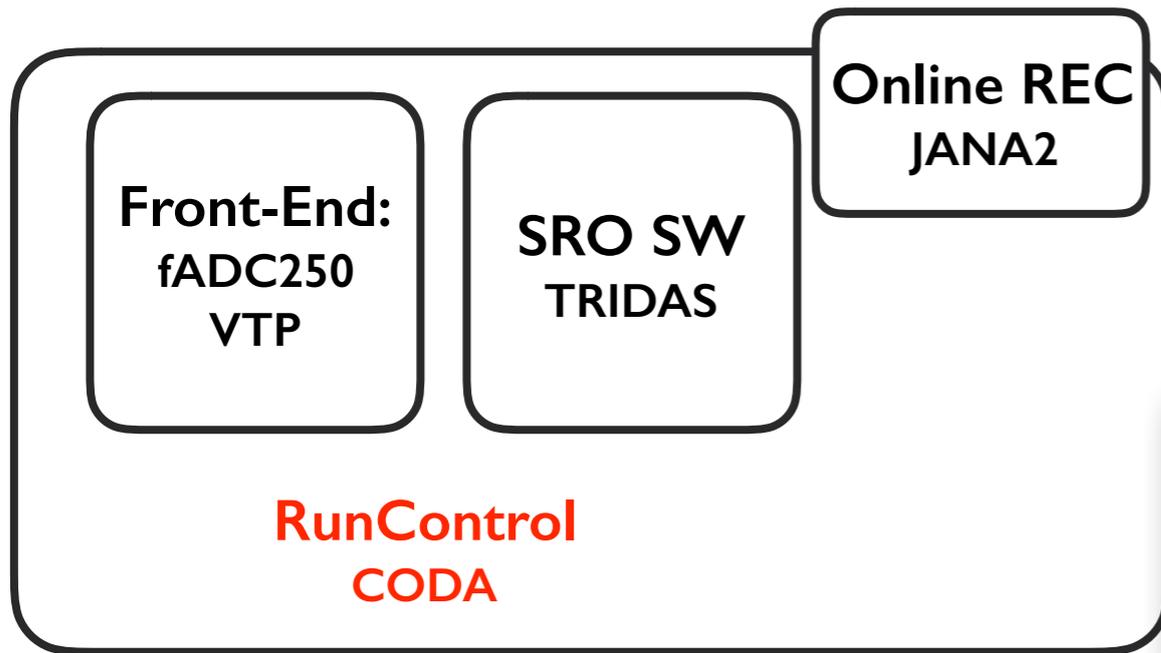

- Peak data rates ~150MBytes total
- Current VTP limit ~2GByte/sec
- Max: 10GBytes/sec

M.Battaglieri - JLAB

High Channel Count Detector

Streaming RO - CLAS12-FT tests

Cebaf Online Data Acquisition (CODA)

- Designed for trigger-based readout systems
- The Event Builder (EV) collects data from 100+ Readout Controllers (ROCs) and VXS Trigger Boards (VTPs)
- The Trigger Supervisor (TS) synchronizes components using clock, sync, trigger and busy signals.

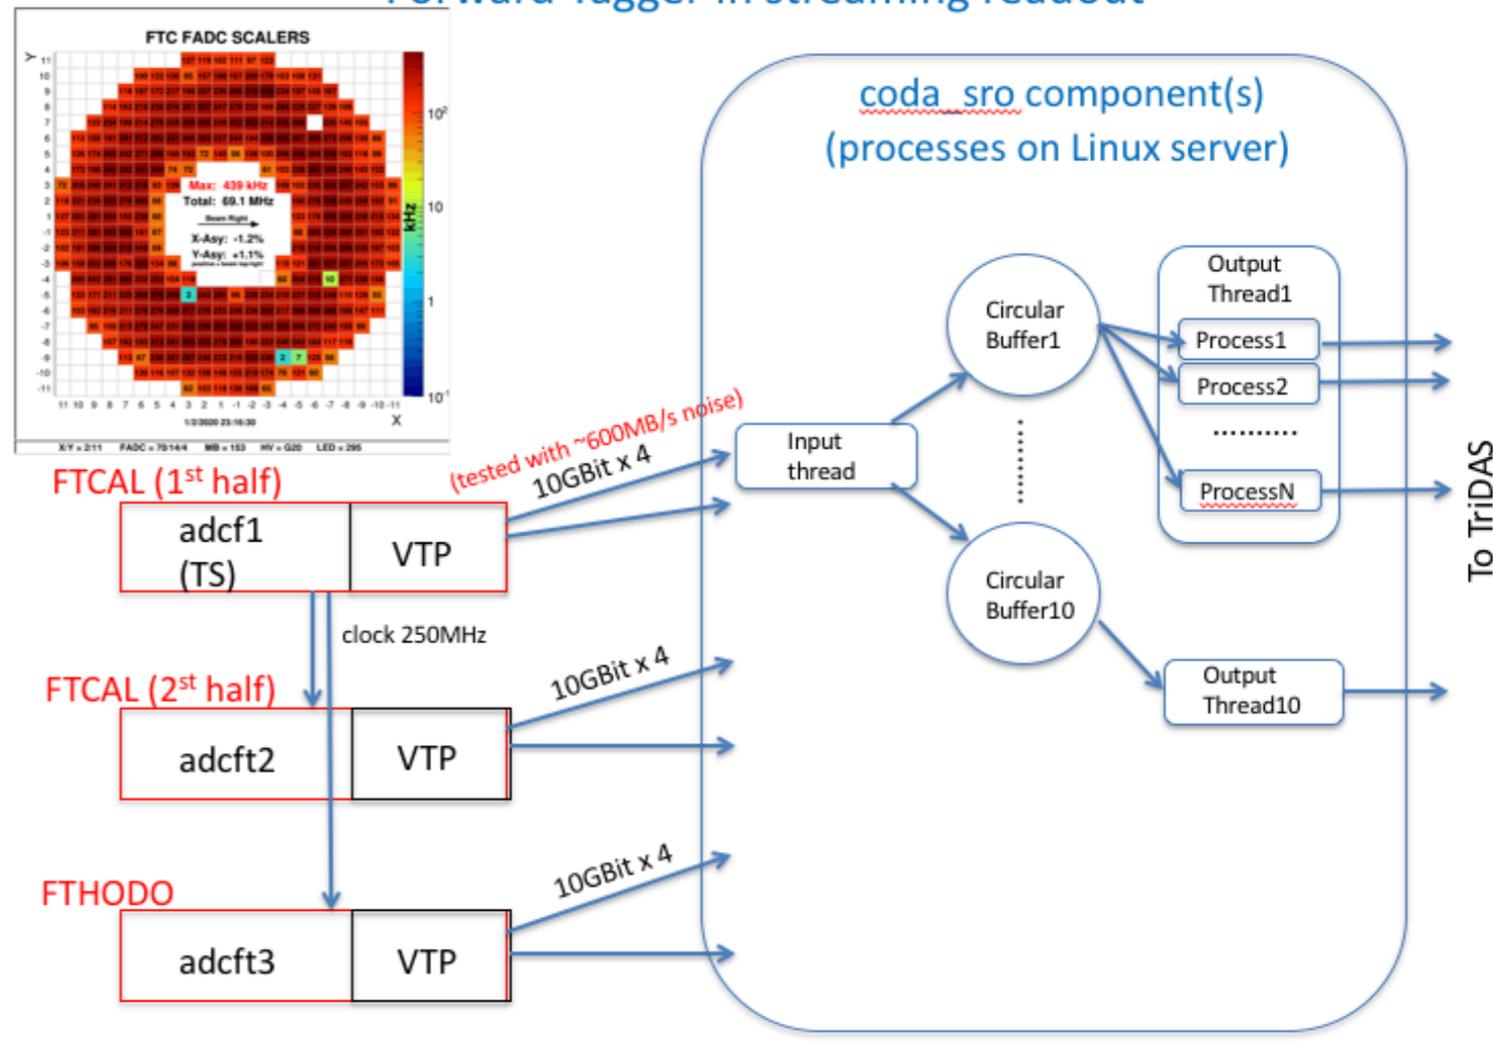

CODA adapted to SRO mode:

- EB replaced with new SRO component and back-end software capable of gluing ROC information based on timestamp instead of event number.
- ROCs not send data on VME bus (only initial configuration)
- Readout performed by VTP boards over serial lines
- 20Gbit/s per crate (up to 40Gbit/s if needed.)

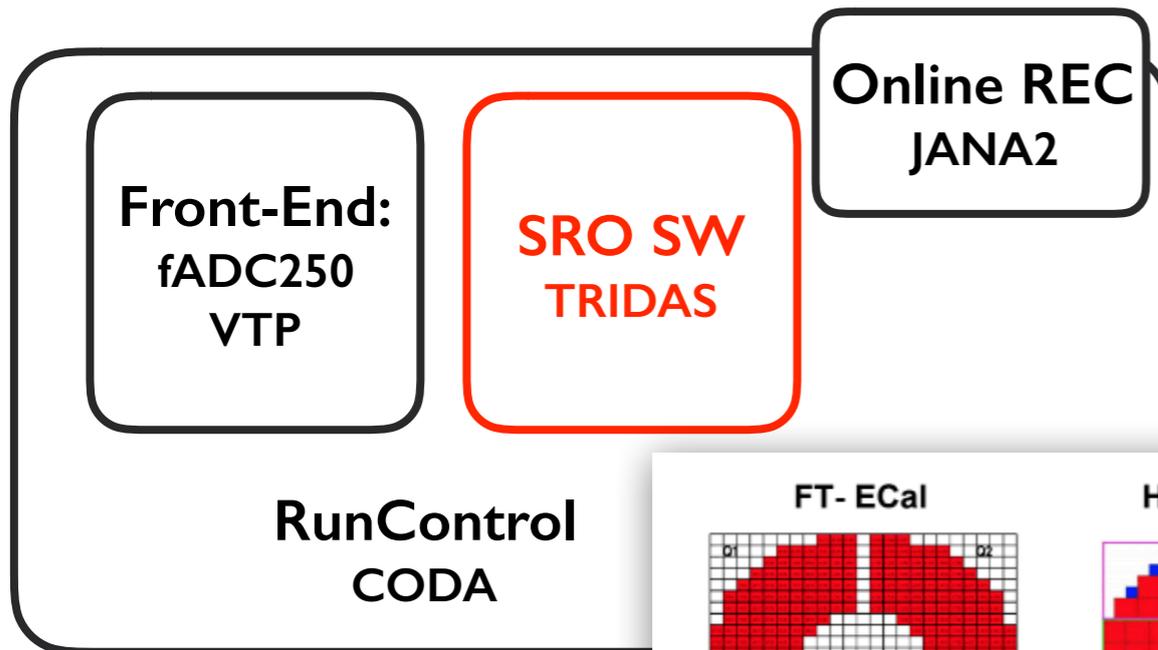

CODA

S.Boyarinov, B.Raydo, G.Heyes

Forward Tagger in streaming readout

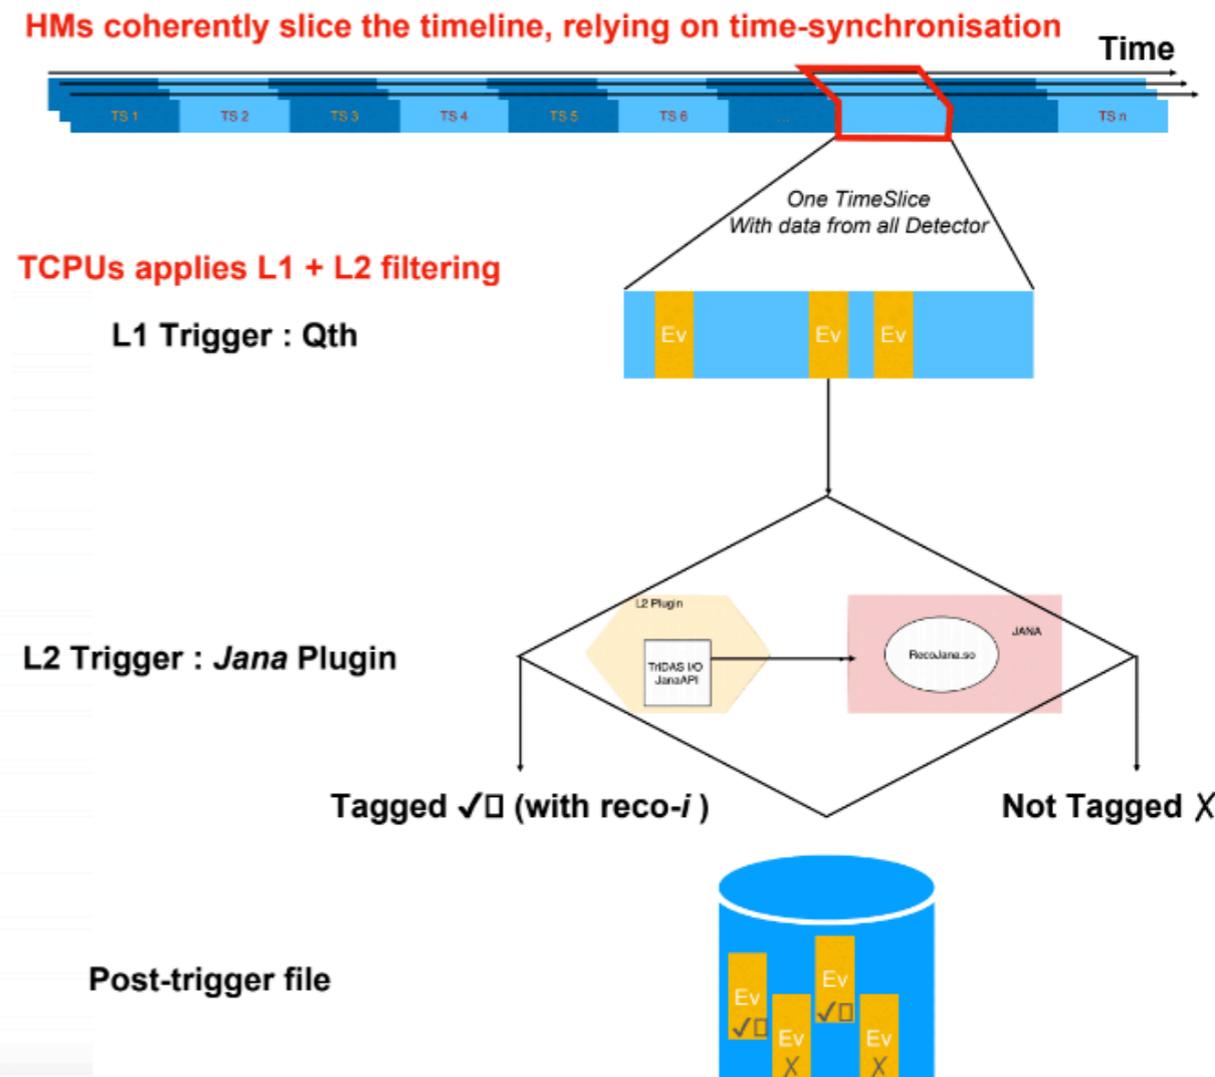

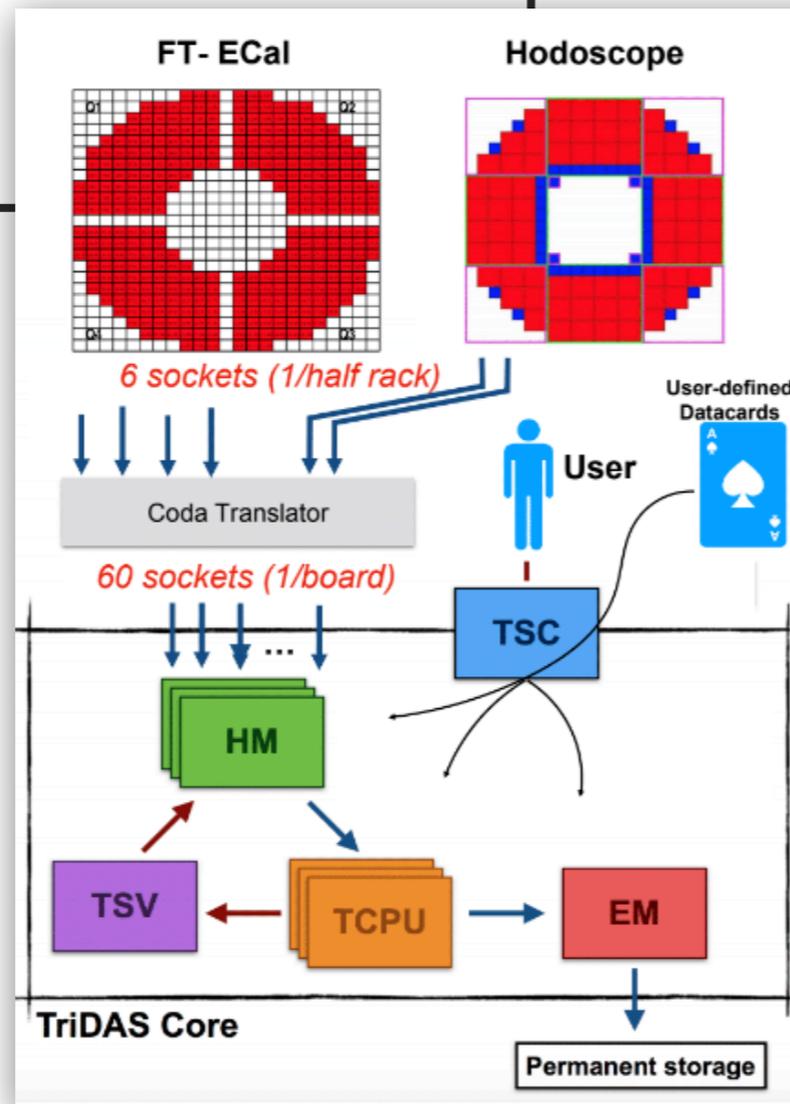

Streaming RO - CLAS12-FT tests

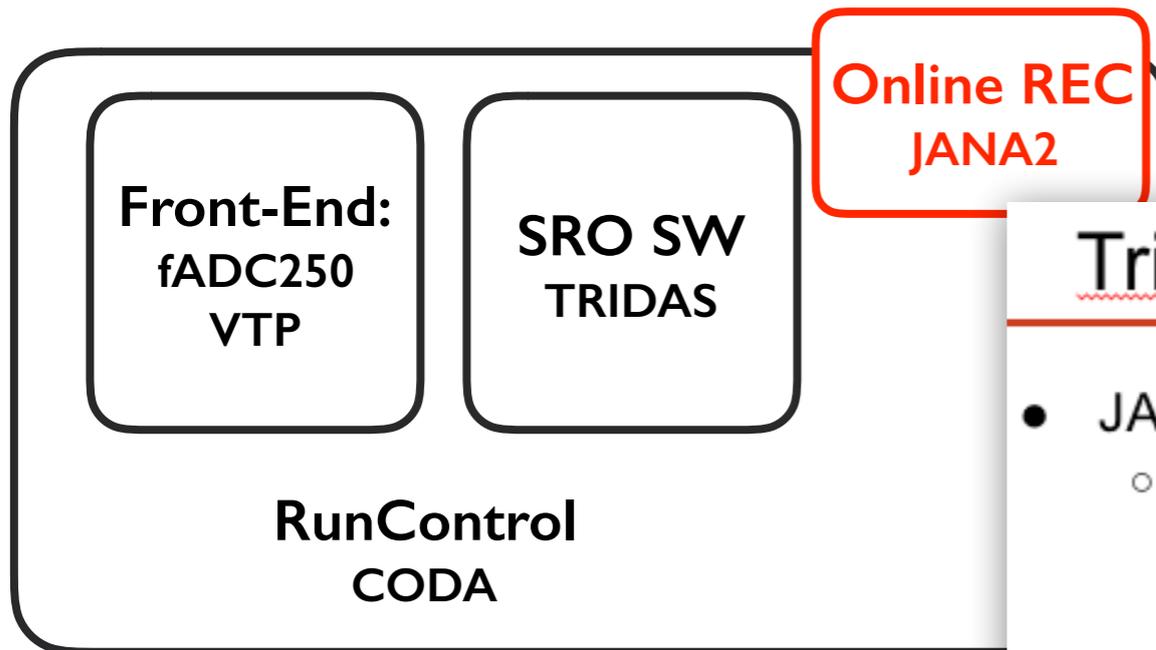

TRIDAS

T.Chiarusi, C.Pellegrino

- TriDAS: backend SRO sw framework
- developed for KM3_NET
- installed on Hall-B cluster
- Tested on multiple CPUs
- FT-Cal rate: 20-30 MHz
- Few hot-channels > 1 MHz
- Dta rate ~50MB/s
- Tests performed with different parameters (thresholds, HM, TCPUs)
- Profiling and performance

Streaming RO - CLAS12-FT tests

FE setup:

- FT-Cal only
- TET (on fADC250)=15/50,
- LI threshold: 2000 (MeV)
- LI time window: 400 ns

JANA2:

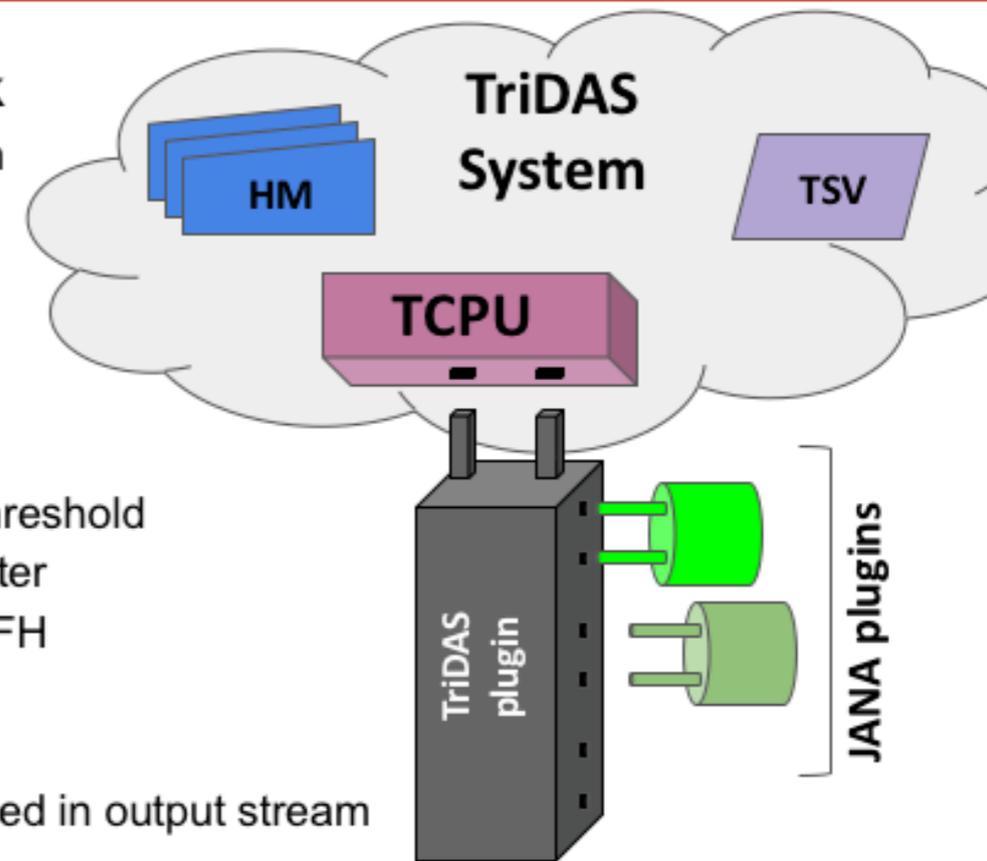

- LI "minimum-bias": at least one crystal with energy > 2 GeV
- scaler (all LI to diskS)
- L2 plugins (*tagging* and *filetring*)
 - "standard" FT-CAL clustering ($N_{\text{cluster}} \geq 1, 2, 3$)
 - cosmic tracking
 - AI clustering algorithm: at least two cluster in the FT-CAL

JANA2 + REC

N.Brei, D.Lawrence,
M.Bondi', A.Celentano, C.Fanelli, S.Vallarino

TriDAS + JANA2

- JANA2: C++ framework
 - Full event reconstruction
 - Calibrations
 - Translation table
 - Multi-threading
 - Software trigger
 - Summed energy threshold
 - Single/Double cluster
 - Coincidence FT + FH
 - Prescale
 - Trigger decisions recorded in output stream

<https://jeffersonlab.github.io/JANA2/>

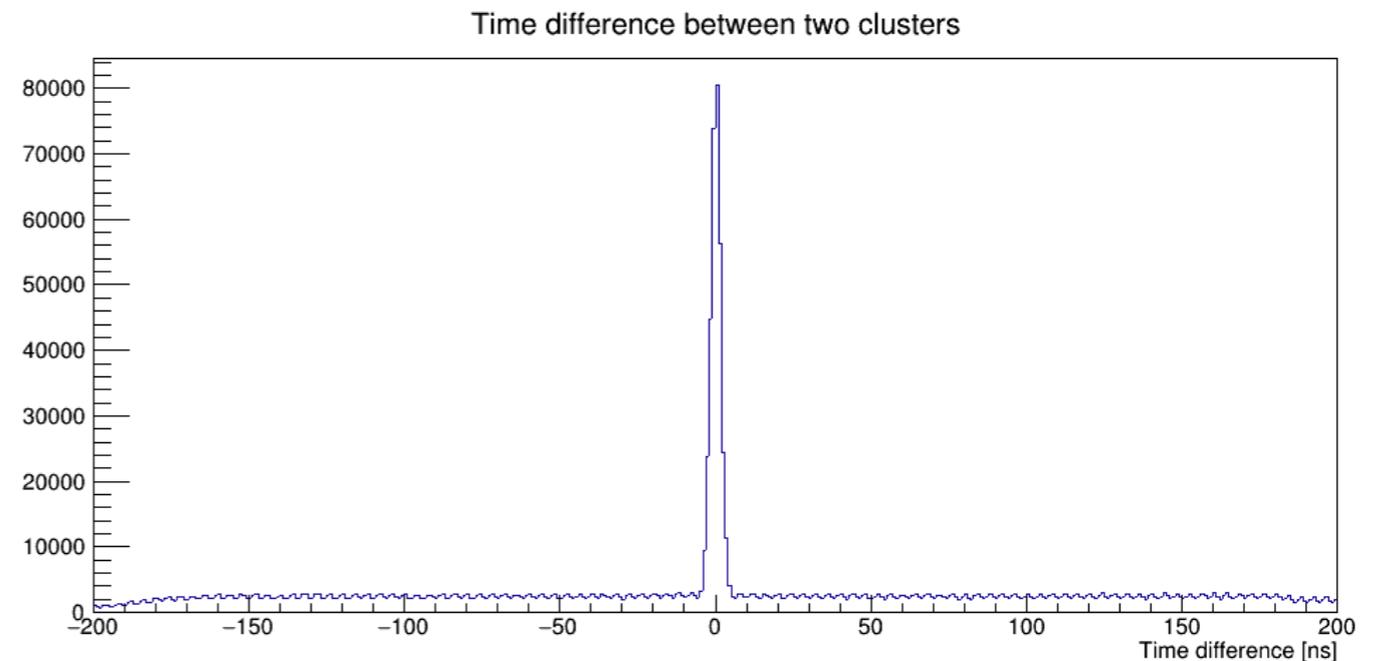

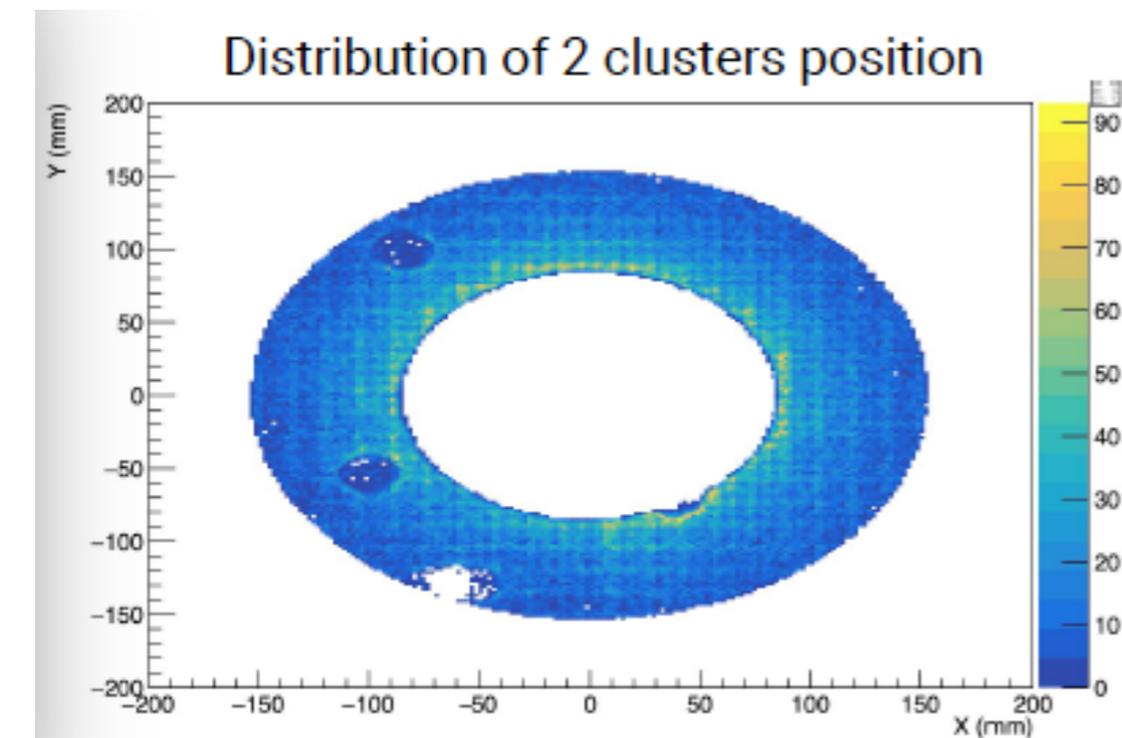

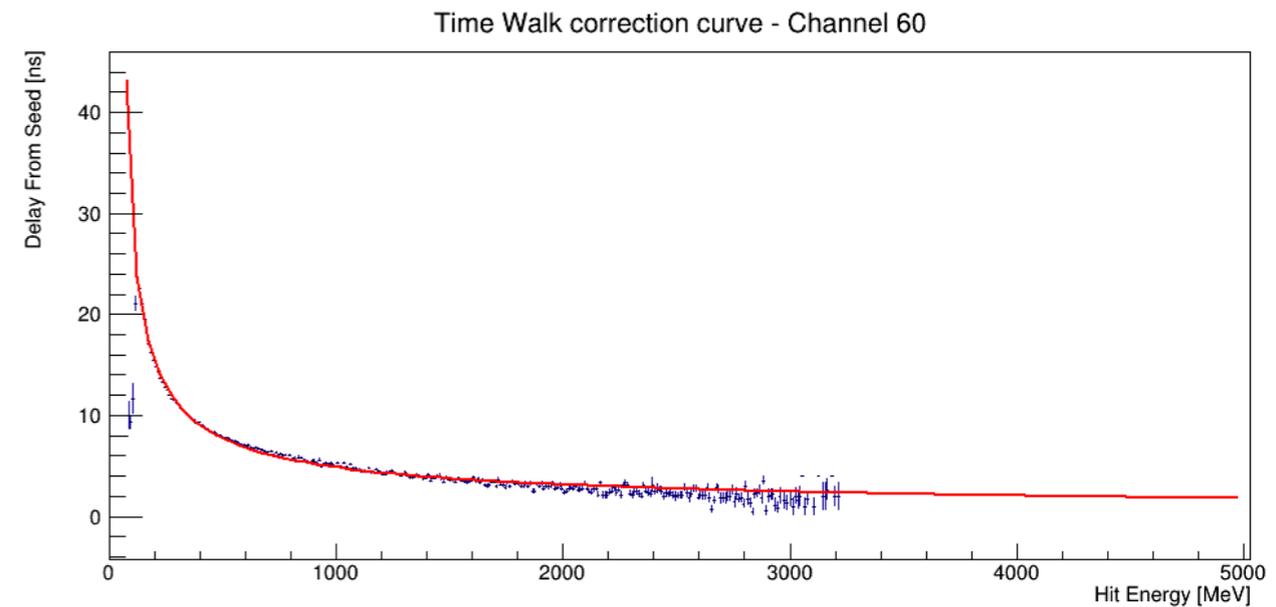

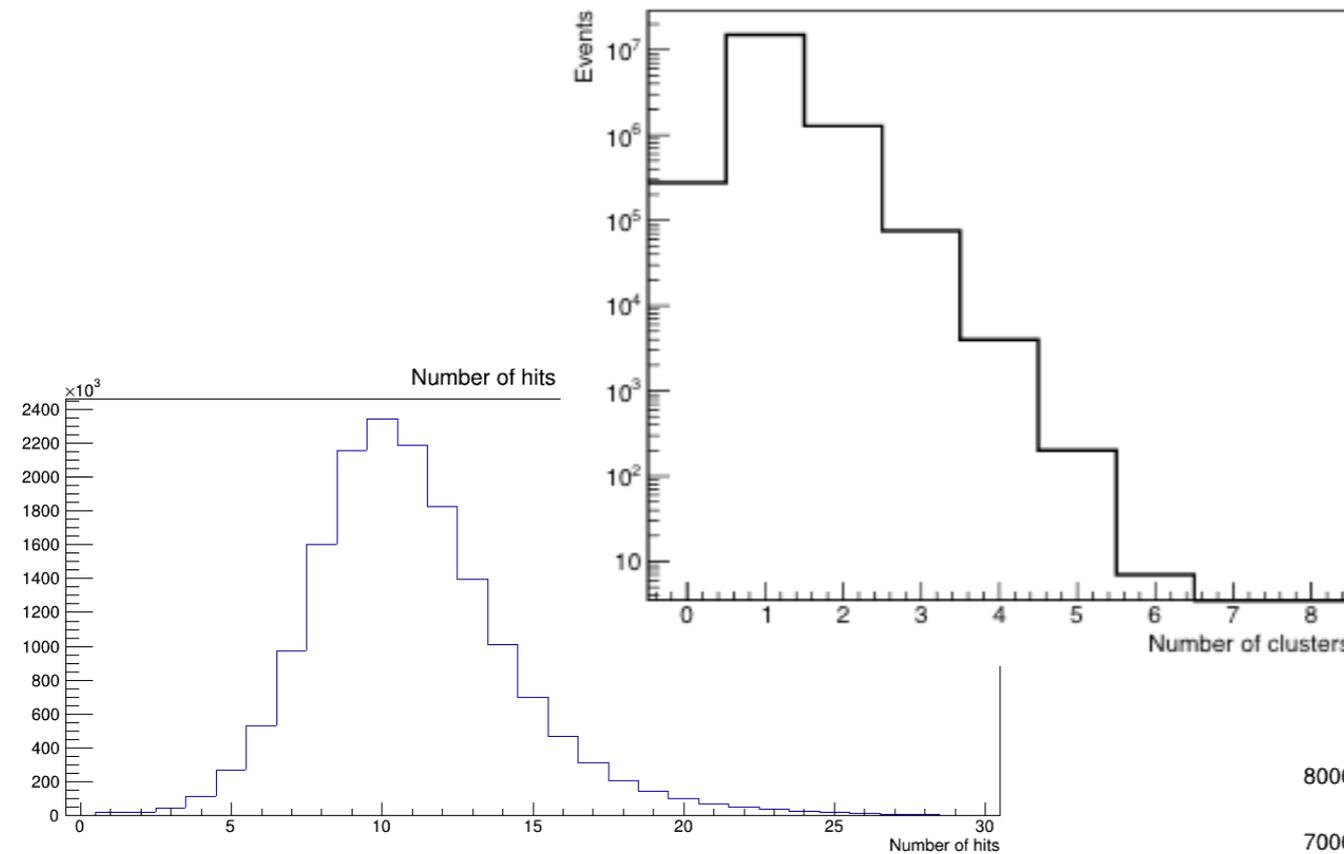

M.Battaglieri - JLAB

JANA Event Source plugin

- Read TriDAS file.pt files for offline analysis
- Offline algorithm development immediately available for use in Software Trigger
- Strong integration between online and offline

Run I Data analysis

M.Bondi, S.Vallarino, A.Celentano

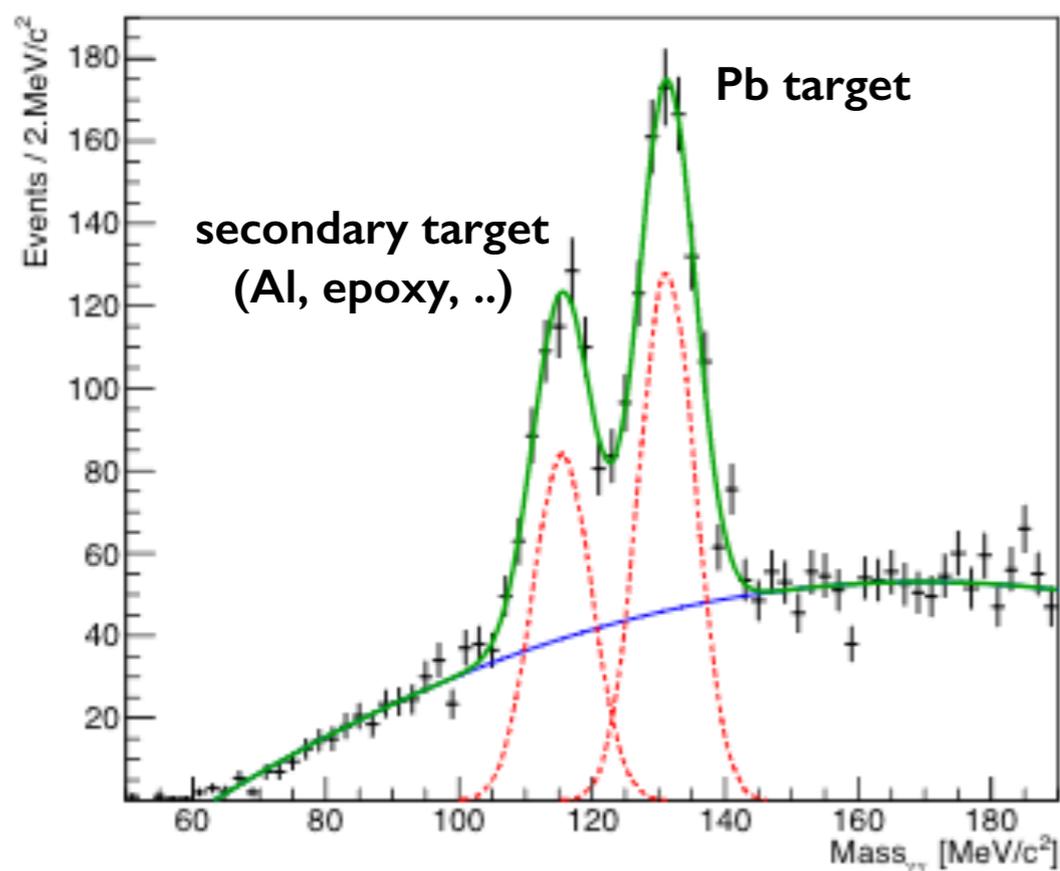

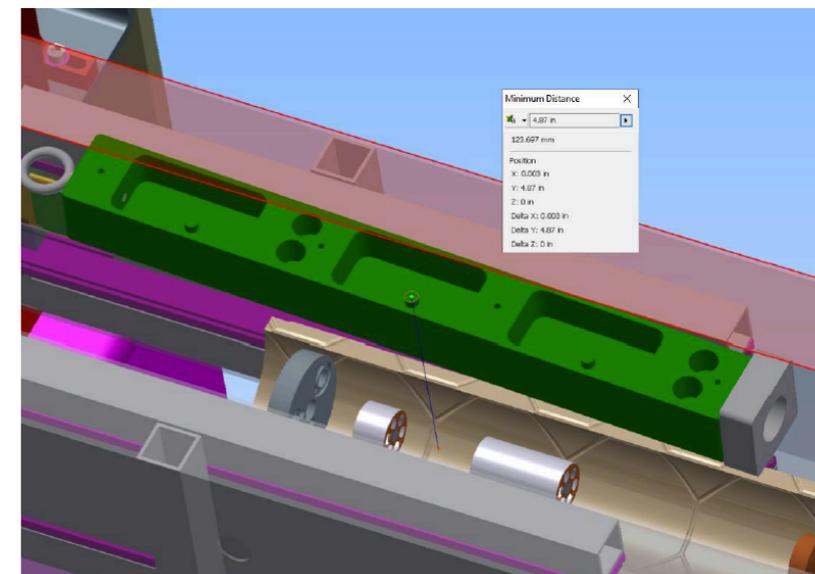

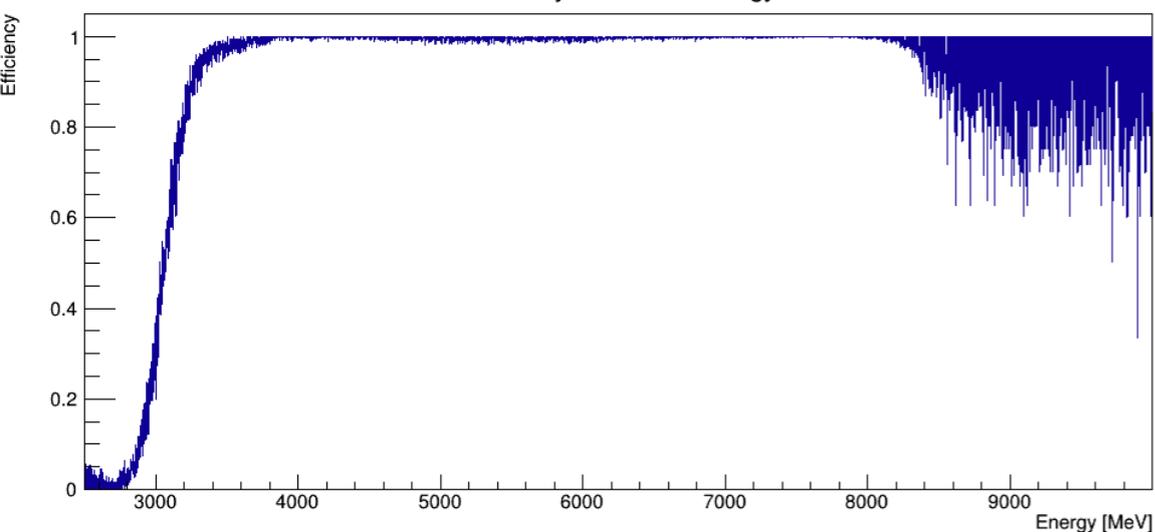

- Time-walk (time) and calibration (energy)
- SRO data behaves as expected (N_{hits} , N_{clusters} , XY_{cluster} , ΔT)

Run I Data analysis

M.Bondi, S.Vallarino, A.Celentano

- Efficiency: comparison between online/offlin clustering

Efficiency Vs Cluster energy

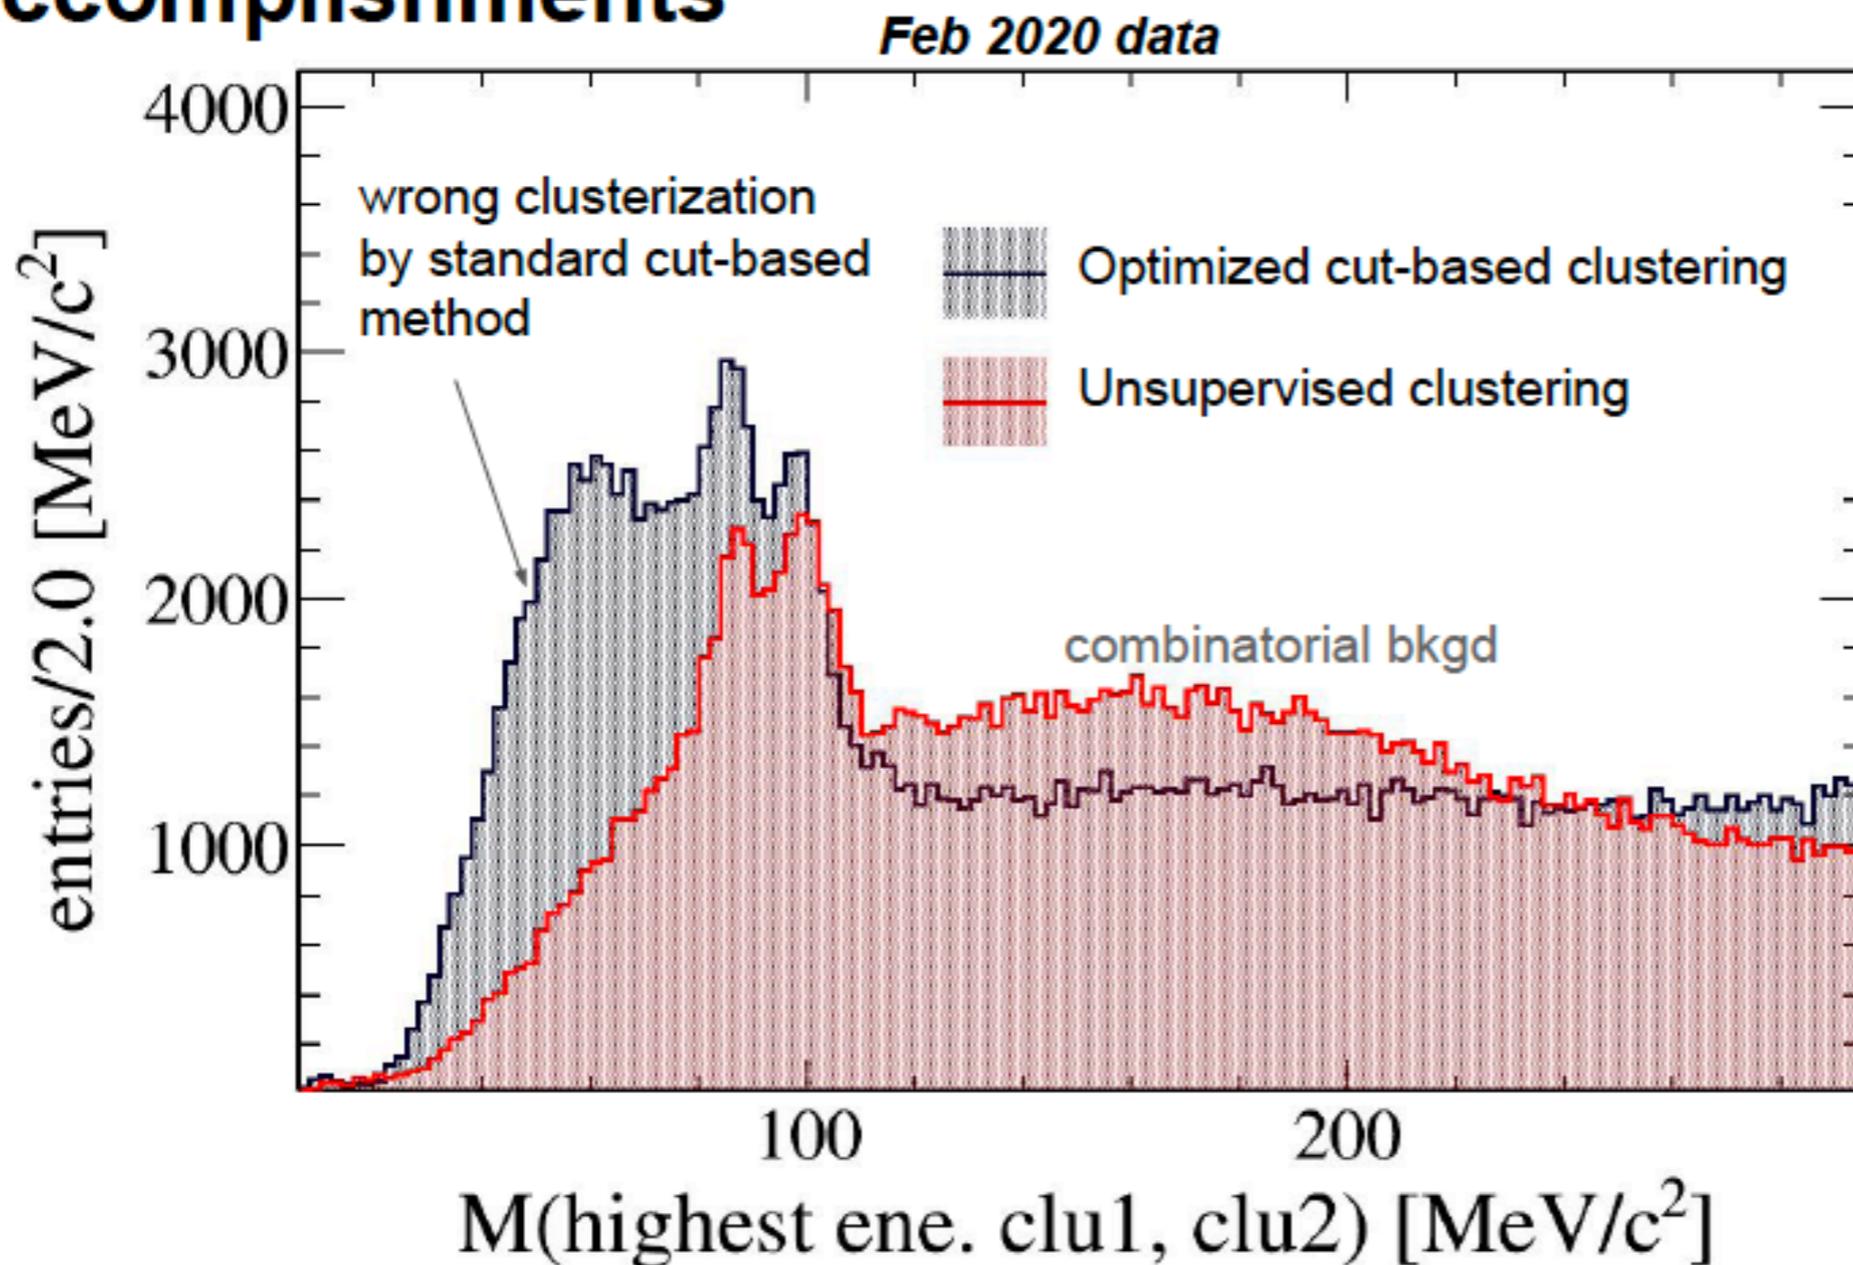

Two pi0 peaks corresponding to two vertices (and a wrong assumption on the vertex position)

- Measured (expected) pi0 yield
Peak 1 = 1365±140 (~1800)
Peak 2 = 930±100 (~420)

M.Battaglieri - JLAB

Run2 data analysis in progress

Accomplishments

- Implementation of AI supported L2 reconstruction algorithms for SRO: offline and online tests accomplished
- Unsupervised (no cuts required) hierarchical clustering generally robust against variations in experimental conditions
- AI tolerates larger hits multiplicities

*The cut-based clustering seems to assign more hits to the highest energy seed cluster.

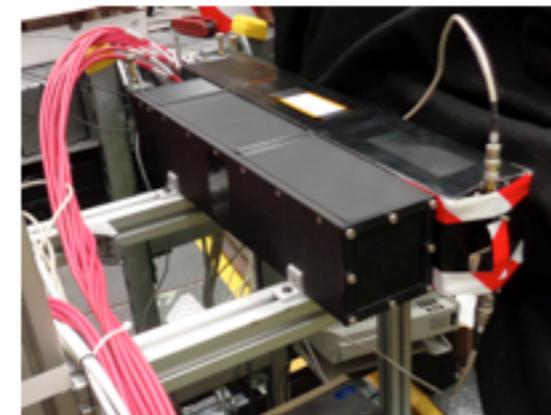

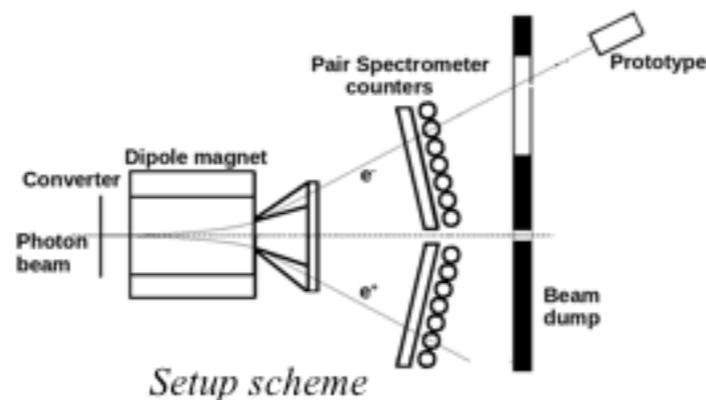

- Run I: off-line only
- Run2: real time!

Data analysis in progress

Streaming RO - Hall-D tests

V.Berdnikov, T.Horn

- HallD parasitic test beam area, secondary lepton beam with energy range (3-6) GeV
- Triggered DAQ with NPS and FCALII prototypes (baseline)
- New prototypes PbWO/SciGlass SiPM or PMT photosensors (3x3 matrix)
- SRO: preamps, fADC or WaveBoard digitizers

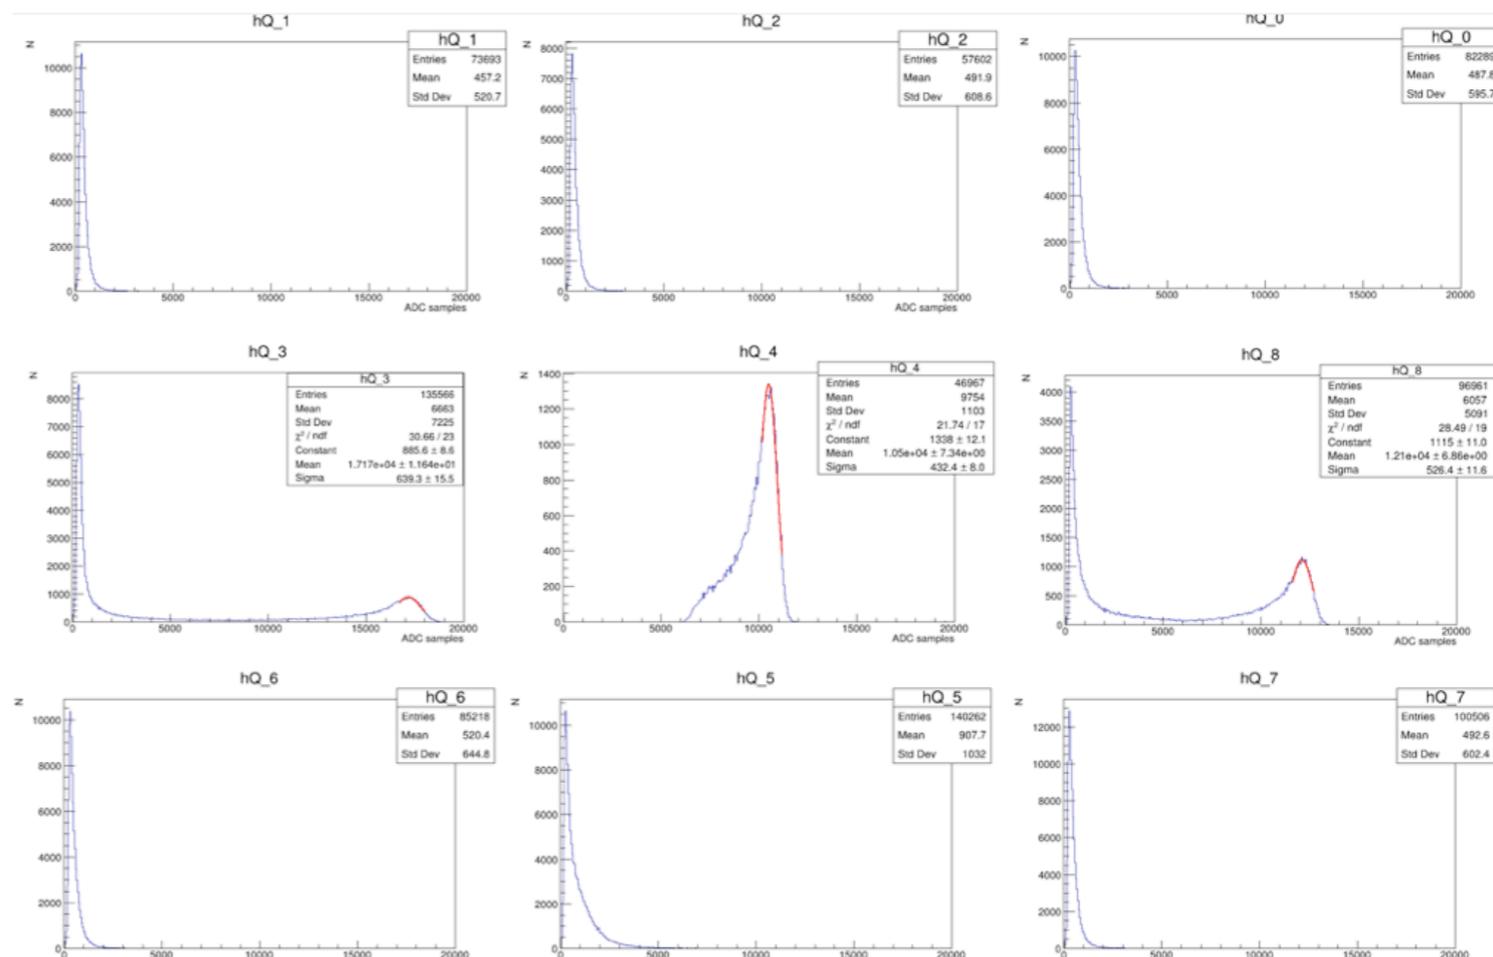

SiPM(left) & PMT(right) cal. prot.

Waveboard

Spring/summer run 2020 HallD tests:

- 3x3 PMT PWO prototype installed
- Baseline performance established with GlueX triggered DAQ (parasitic mode)
- Central cell events hits (PS tile 59) correspond to ~ 4.5GeV lepton
- INFN WaveBoard fADC for SRO tests
- Scintillator pads in front of central cell installed for software L2 trigger
- SRO DAQ cabled/connected and tested

Calorimeter response, channel by channel

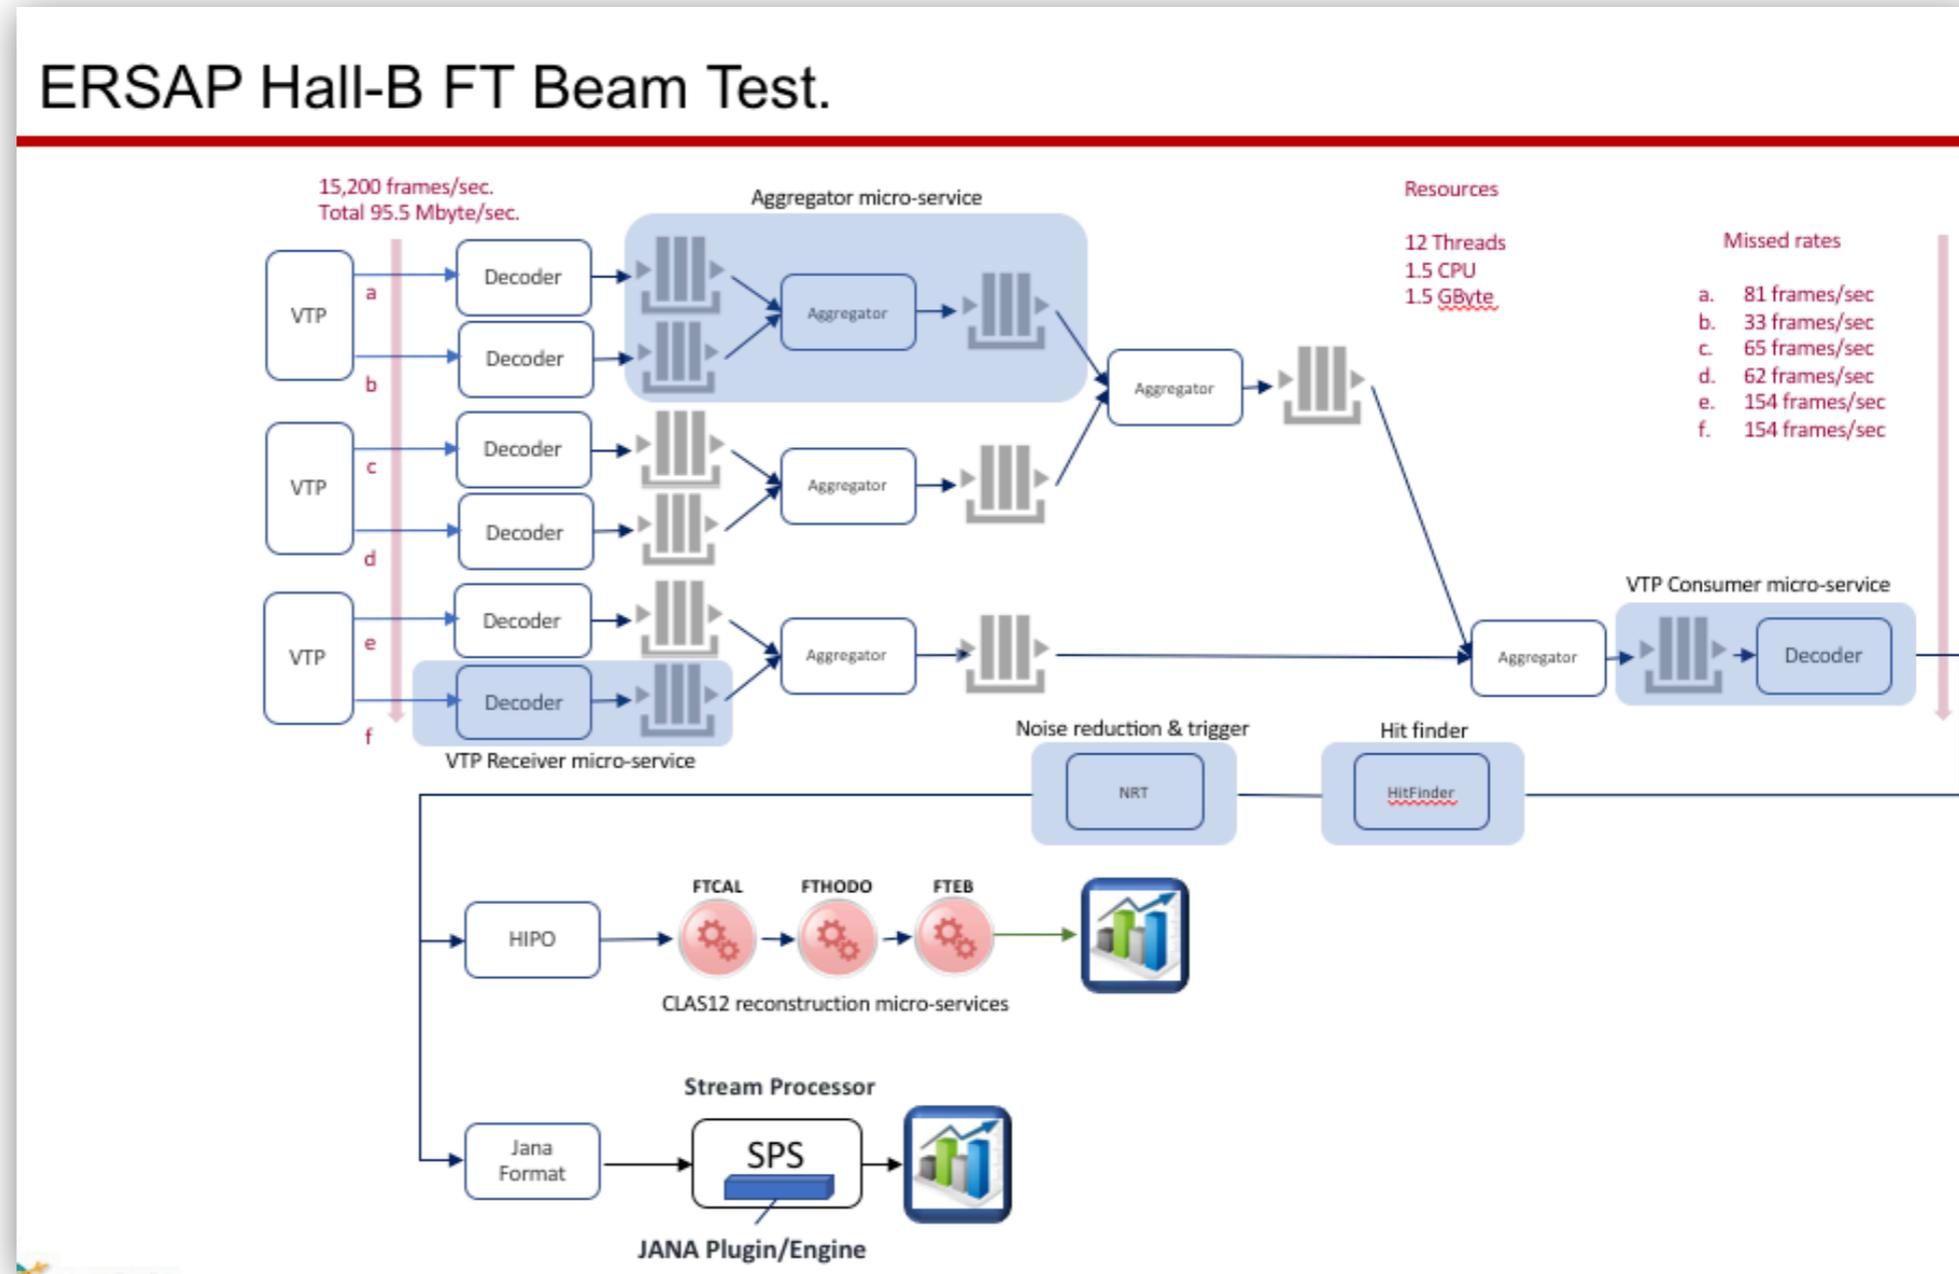

Data analysis in progress

Streaming RO - ERSAP

V.Gyurjyan, T.Chiarusi

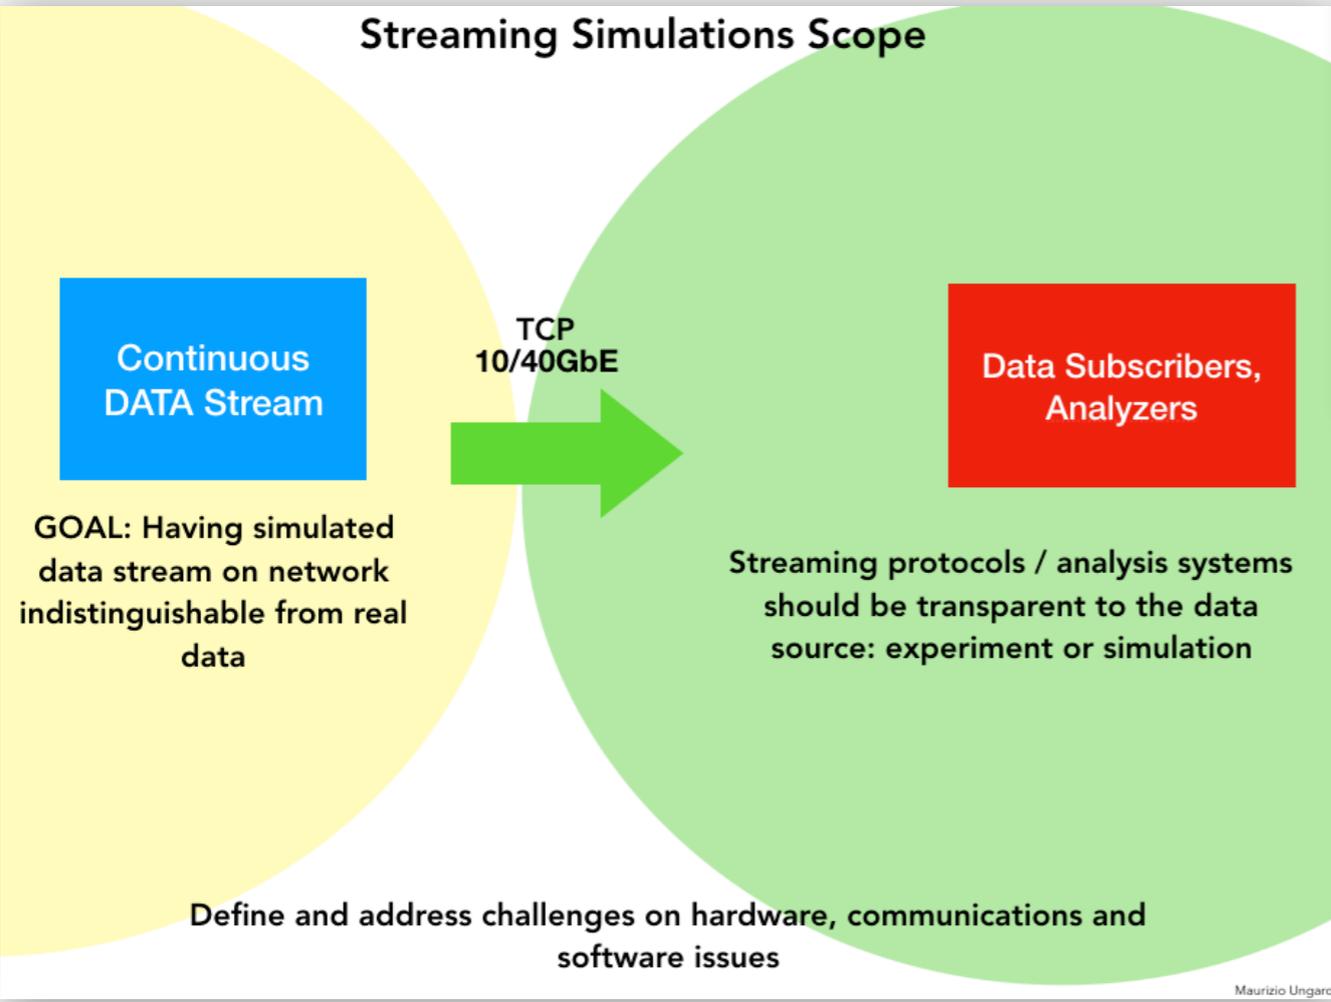

Reactive, event-driven data-stream processing framework that implements micro-services architecture

- Provides basic stream handling services (stream aggregators, stream splitters, etc.)
- Implements tiered memory architecture (stream cooling: hierarchical ring buffers, data lakes, etc.)
- Defines streaming transient-data structure
- Provides service abstraction to present user algorithm (engine) as an independent service.
- Defines service communication channel (data-stream pipe) outside of the user engine.
- Stream-unit level workflow management system and API
- Adopts design choices and lessons learned from JANA, CODA and CLARA

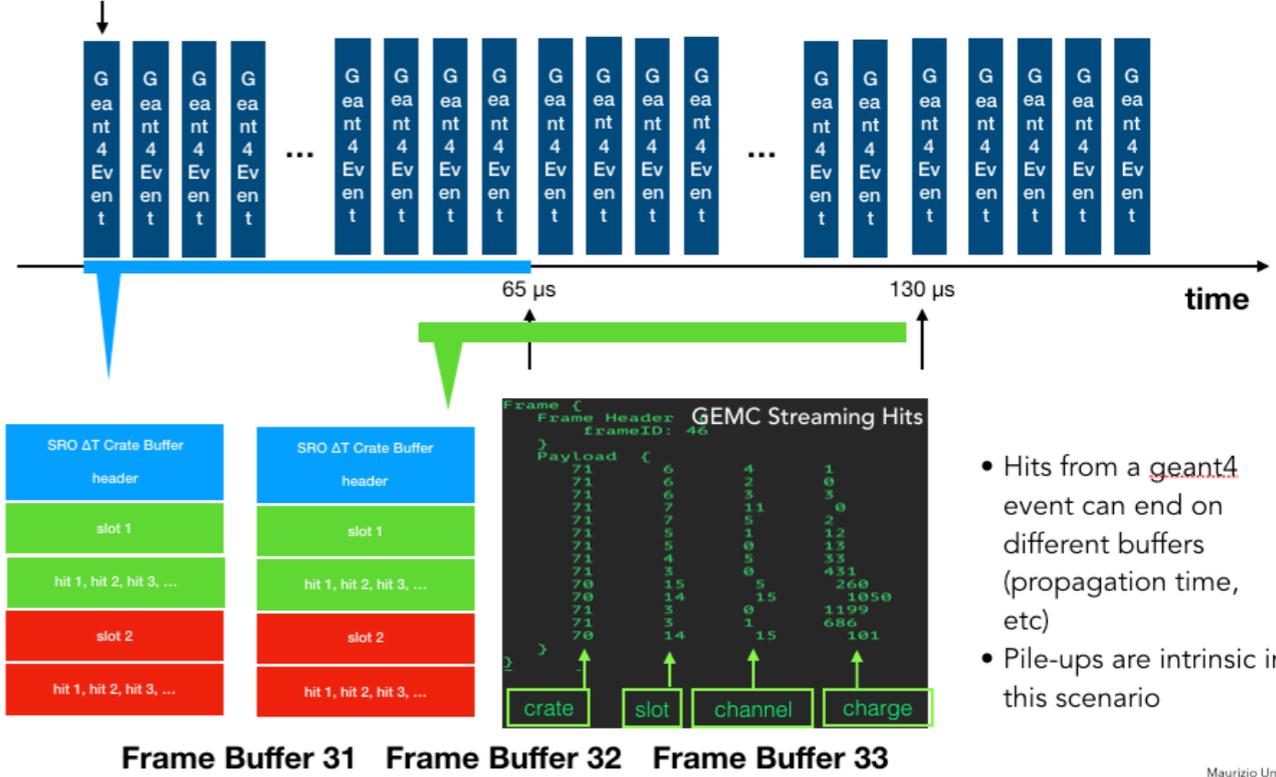

GEMC3: SRO GEANT4 MC

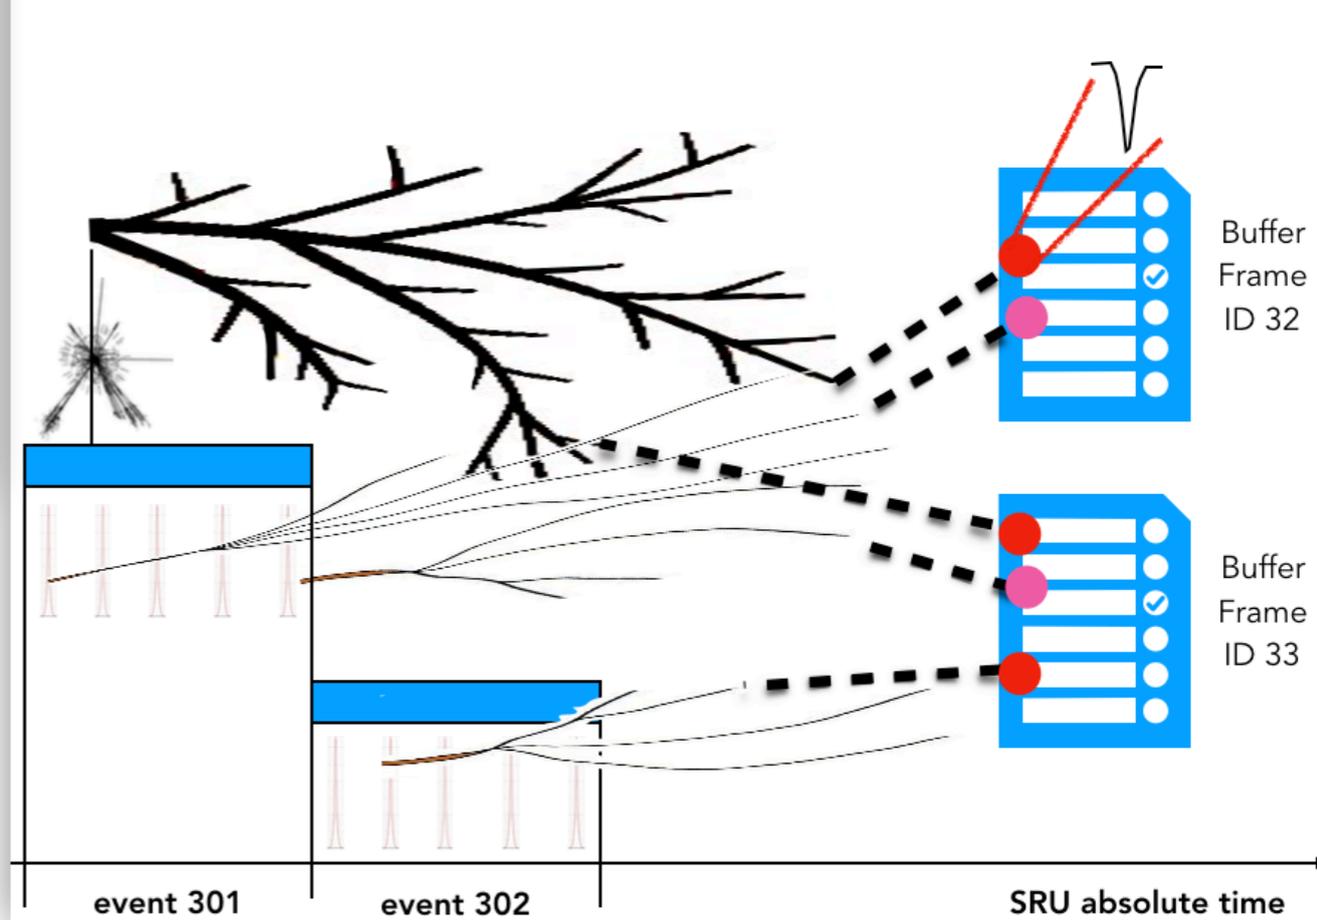

Streaming Simulations Scope

1 geant4 event is (for example) 1 μs long

GEMC: Accumulating geant4 hits in SRU Frame Buffers

Near future: on-beam tests CY21

Jefferson Lab (Oct-Jan 21/22)

- New Hall-B/Hall-D on-beam tests planned for fall 2021
- Similar experimental set up: CLAS12 FT-CAL, FT-Hodo + Hall-D EIC ECal prototype
- Hall-D tests with VTP + fADC250
- Test of the ERSAP concept
- Quantitative understanding of FE+BE performance
- Test bench for an extension to the entire CLAS12 detector for HI-LUMI ops

DESY (Nov 21)

- Tests in preparation for a TPE experiment
- Detector: array of PbWO4 or ScintGlass (eRDI) → relevance for EIC
- DESY test beam: Direct comparison of classic gated QDC readout vs SRO, using CAEN and JLAB electronics.
- Can we get extra information from pulse shape?
- Goal: get experience with SRO, compare results, find up/downsides

BNL

- see Jin talk's!

M.Battaglieri - JLAB

Summary

- Streaming RO is 'THE' option for future electron beam experiments
- Take advantage of the full detector's information for an optimal (smart) tagging/filtering
- So many advantages: performance, flexibility, scaling, upgrading ...
... but, has to demonstrate to be as effective (or more!) than triggered systems
- Streaming Readout on-beam tests performed using the CLAS12-FT-Cal at JLab
- The full chain (FE + SRO sw + ON-LINE REC) tested with existing hw
- Data taken in full streaming mode, analysis in progress (traditional and AI-supported)
- Parallel activity in a more controlled situation (Hall-D PS test e-/e⁺beam)
- New tests planned at JLab and DESY in fall 2021
- Implementing the FT model in a SRO G4 MC to check the full chain
- Parallel effort for a JLab SRO framework based on micro-services architecture
- SRO prototype to be tested in view of a massive implementation of full CLAS12 SRO
- Built a real SRO prototype and a work team!

M.Battaglieri - JLAB

Many thanks to the whole JLab SRO team:

F.Ameli (INFN), MB (JLab/INFN), V.Berdnikov (CUA), S.Boyarinov (JLab) M.Bondí (INFN), N.Brei (JLab), L.Cappelli (INFN) A.Celentano (INFN), T.Chiarusi (INFN), C.Cuevas (JLab), R. De Vita (INFN), C.Fanelli (MIT), G.Heyes (JLab), T.Horn (CUA), V.Gyurjyan(JLab), D.Lawrence (JLab), L.Marsicano (INFN), P.Musico (INFN), C.Pellegrino (INFN), B.Raydo (JLab), M.Ungaro (JLab), S.Vallarino (INFN)
