Nucleon-Nucleon Short Range Correlation (SRC)

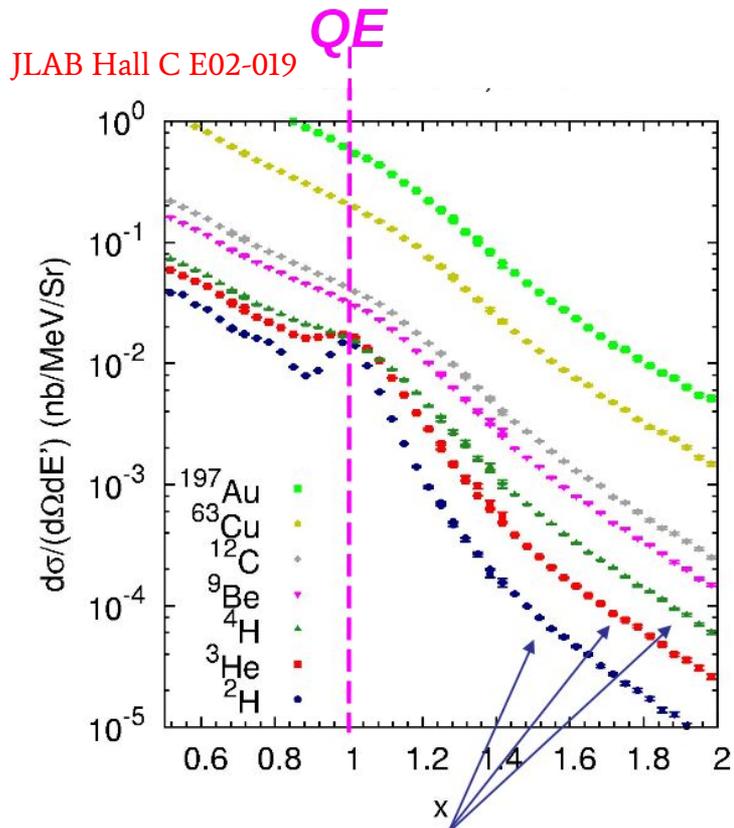

Free nucleon-nucleon potential = **Repulsive core** + **attractive tensor force**

$T = 1, S = 0$: np, pp, nn pairs. The tensor operator $S_{1,2} = 0$, no attractive tensor force

$T = 0, S = 1$: Deuteron-like np pair.

Measurements:

1H, 2H, 3H, 3He, (C12, Ti48) inclusive cross sections at $0.6 < x < 3$

Primary Physics Topics:

Check the 2N SRC isospin dependence at $1 < x < 2$, and also 3N momentum sharing configuration.

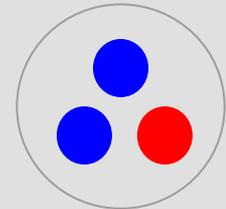

np pair dominates:

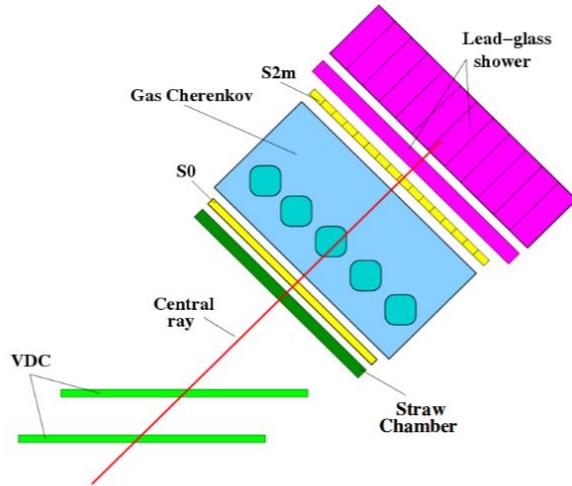

$$\frac{\sigma_{3H}}{\sigma_{3He}} = \frac{\sigma_{np} + \sigma_n}{\sigma_{np} + \sigma_p} \simeq \frac{\sigma_{np}}{\sigma_{np}} = 1$$

no isospin preference:

$$\frac{\sigma_{3H}}{\sigma_{3He}} = \frac{2\sigma_{nn} + \sigma_{pp}}{\sigma_{nn} + 2\sigma_{pp}} \xrightarrow{\sigma_p \sim 3\sigma_n} 0.7$$

Dominant channel:

$$\frac{\sigma_{^3H}}{\sigma_{^3He}} = \frac{2\sigma_{nn} + \sigma_{pp}}{\sigma_{nn} + 2\sigma_{pp}} \xrightarrow{\sigma_p \sim 3\sigma_n} 0.7$$

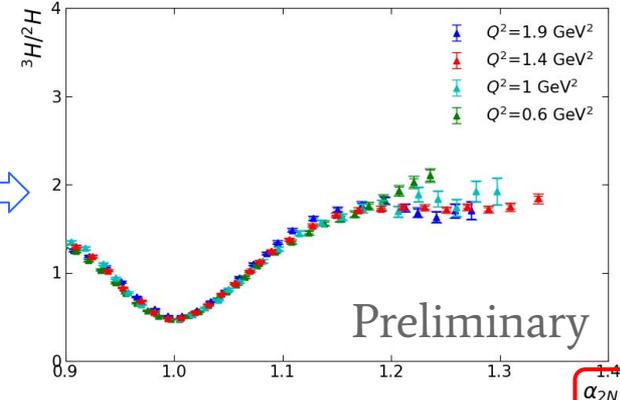

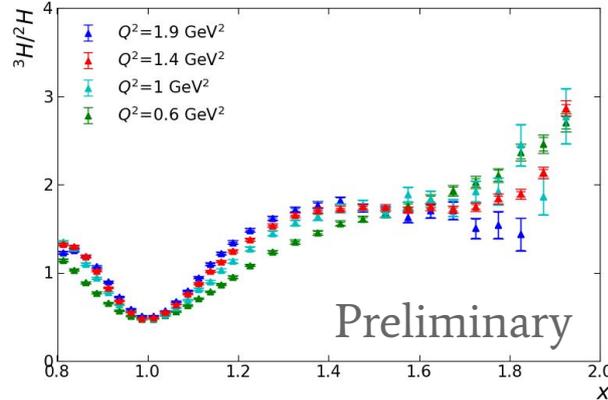

3N-SRC contribution is predicted to dominate at somewhere $\alpha_{3N} > 1.6$. Ratio will drop from 2N-SRC plateau

Mean-field to SRC transition

Theoretical calculations are desired!

Light cone variable:

$$\alpha_{2N} = 2 - \frac{q_- + 2m}{2m} \frac{\sqrt{W^2 - 4m^2} + W}{W}$$
