User Board

The SHMS-HMS User Group was formally started at the 2009 Hall C summer workshop when the initial user board was appointed by the Hall C leader. Members were appointed with staggered terms. As the terms of the initial board expire, elections are held by the user group to replace board members.

Current Board 2020—2021

Rotating out this year

Elections will be held soon!
Expect to hear from David Hamilton
SHMS NIM paper status

The draft is on overleaf; no changes since the January meeting; Roger Carlini is coordinating

Abstract

The Super High Momentum Spectrometer (SHMS) has been built for Hall C at the Thomas Jefferson National Accelerator Facility (Jefferson Laboratory). With a momentum capability reaching 11 GeV/c, the SHMS provides measurements of secondary charged particles produced in electron scattering experiments using the maximum available beam energy from the upgraded Jefferson Lab accelerator. The SHMS is an ion-optics magnetic spectrometer comprised of a series of new superconducting magnets to transport events on an array of triggering, tracking, and particle-identification detectors that measure momentum, energy, angle and position in order to allow kinematic reconstruction of the events back to their origin at the scattering target. The detector system is protected from background radiation by a sophisticated shielding enclosure. The entire spectrometer is mounted on a rotating support structure which allows measurements to be taken with a large acceptance over laboratory scattering angles from 5.5° to 40°, thus allowing a wide range of low cross-section experiments to be conducted. These will complement and extend the previous Hall C research program to higher energies.

Keywords: Magnetic spectrometer, Electron scattering, Tracking detectors, Particle identification, Electron calorimetry, Radiation shielding.

1. Introduction

Introduction section. Author Organizer: D. Gaskell

1.1. Jefferson Lab Overview

The electron beam at Jefferson Lab operates at high duty cycle, with beam repetition rates of 249.5 or 499 MHz delivered to the experimental halls. High beam polarization (> 80%) is also routinely available.

In the 6 GeV era, Halls A, B, and C executed a large program of experiments focusing primarily on electron...
