

Accelerating science: the usage of commercial clouds in ATLAS Distributed Computing

Fernando Barreiro Megino on behalf of the ATLAS experiment
CHEP 2023, Norfolk, USA

ATLAS cloud projects

- Amazon
 - Current funding round: July 2020 - May 2023
 - Credits purchased by California State University at Fresno
- Google
 - Conversations and short R&Ds since several years. Stable relationship since ~2018
 - Latest project based on “User Subscription Agreement” for US public sector
 - July 2022 - October 2023
 - Duration, scale and cost agreed before project
 - Tracks for Cloud-site, R&Ds and Total Cost of Ownership (TCO)

What are we looking for in the cloud?

New ideas and evolution

Complementary sources for computing power

Elastic usage

Access to architectures not available on-prem

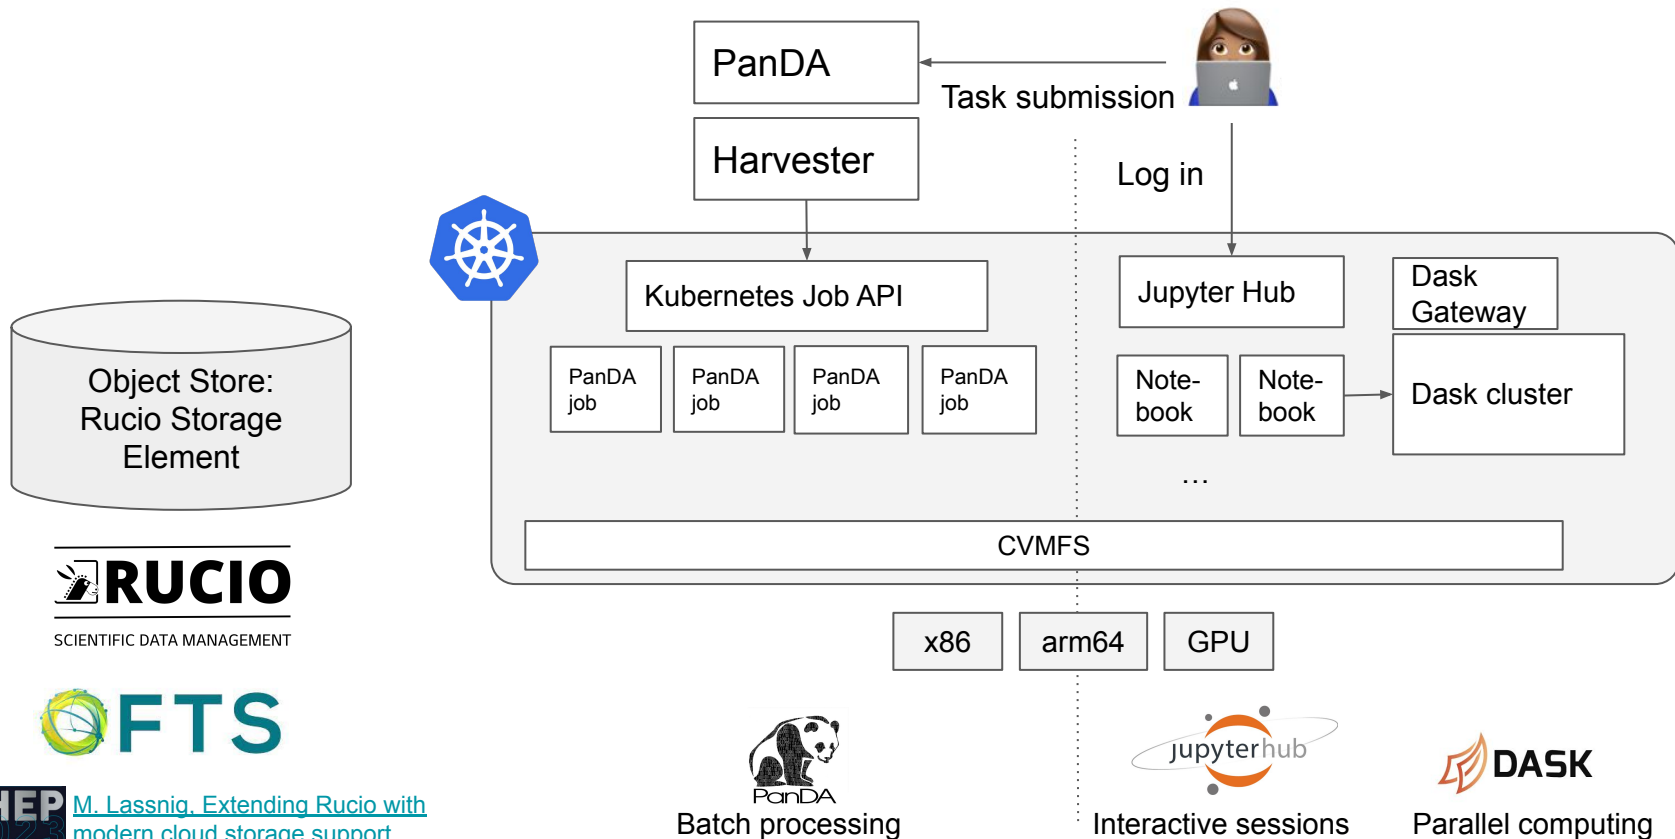

Low-maintenance

Cloud native integration

Seamless integration of commercial Clouds with ATLAS Distributed Computing

Additional compute resources on Google Cloud

GOOGLE vCPUs used by running jobs

WallClock Consumption of Successful and Failed Jobs

4% failed wallclock: mostly application issues, initial setup issues, Spot & DDM failures

No interventions needed since setup

Overall ATLAS including Grid, HPC, P1, BOINC, Cloud... vCPUs used by running jobs

WallClock Consumption of Successful and Failed Jobs

8% failed wallclock: higher failure rate concentrated at particular, unpledged sites

Elastic processing on Google Cloud

100k

Running vCPUs on regional GKE cluster in eu-west-1

$O(10^5)$ vCPUs
 $O(10^4)$ Pods
 $O(10^3)$ Nodes
1 managed K8S cluster
<1 Engineer

Heterogeneous architectures: GPU

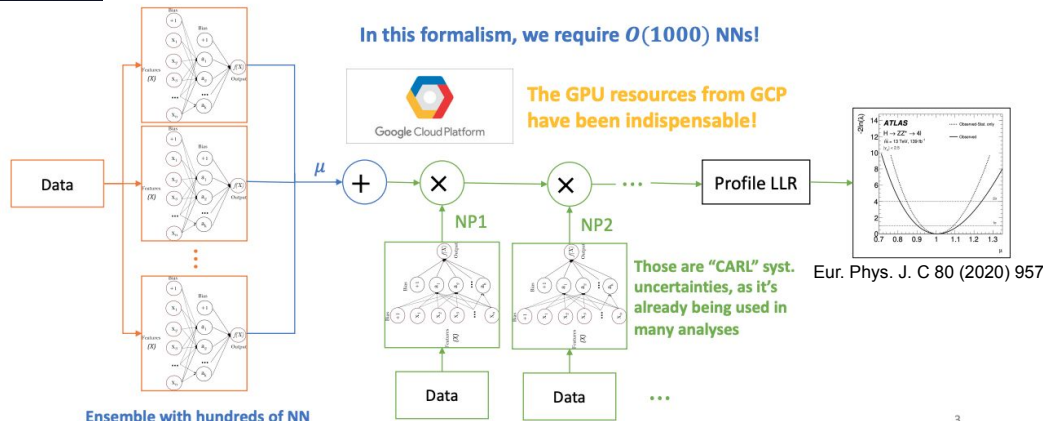

CHEP
2023

[J. Sandesara. ATLAS data analysis using a parallelized workflow on distributed cloud-based services with GPUs](#)

1. Development on GPU notebook

2. Training at scale through PanDA GPU queue

3. Fitting on mega-memory notebook (1.4TB) or PanDA queue

On demand GPU queue
800 CPUs, 200 GPUs (Nvidia T4)

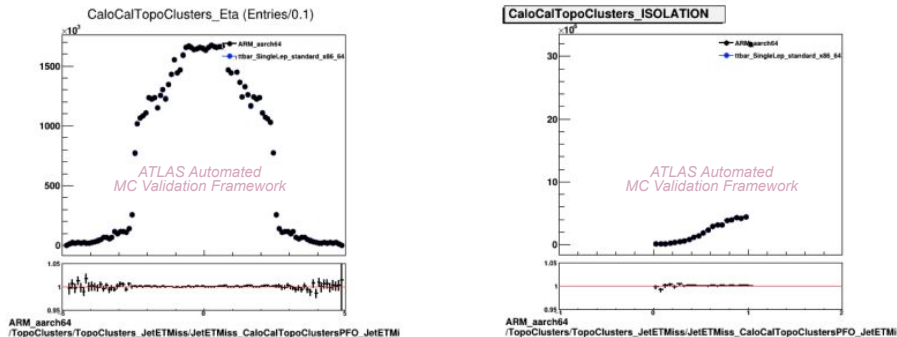

Heterogeneous architectures: ARM

Physics Validation for Athena Simulation and Reconstruction on ARM signed off

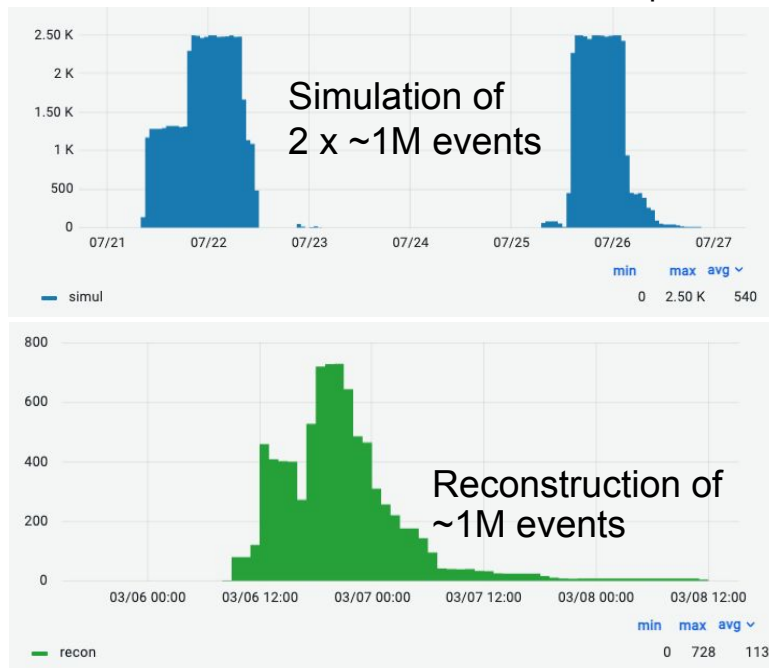

First ATLAS tasks on ARM: Amazon Graviton 2 processors

ttbar_SingleLep

no significant difference

Example plots from calorimeter cluster validation of aarch64 vs x86_64

Distributed, interactive analysis

- Data science community technologies
- Configured for scalability and cost effectiveness on GKE
- Notebooks boot on demand a variety of instances (GPU, XXL)

The screenshot shows the ATLAS Experiment dashboard on the left, with a sidebar containing navigation links like 'MEMORY BY KEY', 'PROCESSING', 'WORKERS', etc. The main area displays a JupyterLab notebook with Python code for distributed analysis using Dask and RUCIO. The code includes functions for getting RUCIO clients, uploading data, and running a parallel computation. A 'jupyterhub' logo is overlaid on the notebook. Below the notebook, a 'Task Stream' plot shows the progress of the computation, and a 'DASK' logo is overlaid on the plot.

Infrastructure as Code

```
PyCharmProjects - main.tf [gcp-cluster-creation-scripts]
main.tf
26 resource "google_container_node_pool" "gpu-highmem-4" {
27   provider = google-beta
28   name     = "gpu-highmem-4"
29   location = var.region
30   cluster  = google_container_cluster.panda-gpu-rnd.name
31
32   autoscaling {
33     min_node_count = 0
34     max_node_count = 200
35   }
36
37   management {
38     auto_repair = true
39     auto_upgrade = true
40   }
41
42   node_config {
43     spot = true
44     machine_type = "n1-highmem-4"
45     disk_size_gb = 300
46
47     disk_type = "pd-standard"
48
49     guest_accelerator {
50       type = "nvidia-tesla-t4"
51     }
52   }
53 }
```

- GCP infrastructure management through Terraform: repeatable infrastructure
- Initial development is tedious, but helps in the long run when trying to replicate a setup
 - No clicking through UI and having to remember all options
 - Share recipes in the team

Conclusions

- Cloud native integration: working at scale
- Many of the technologies are game-changers and available for on-prem
- There are challenges when not following the mainstream path
 - So far solved with creative ideas
 - Further work is needed to complete the WLCG fabric integration
- Cloud resources enabled R&Ds (GPU, mega-memory nodes, ARM, Dask) that would have been very difficult to carry out on the Grid or on-prem clusters
- Running “à la Grid” is technically possible, but not the most cost effective way
 - In particular due to very high egress costs
- Ongoing Total Cost of Ownership studies to understand subscription models and list prices
