

Annual Earned Value Management System (EVMS) Refresher Training

This presentation is an annual review of the Jefferson Science Associates' Earned Value Management System (EVMS) and provides refresher training to Project Managers, Associate Project Managers and Control Account Managers on the objectives, policies, procedures, processes and standards associated with Jefferson Lab's certified Earned Value Management System.

Earned Value Management is a systematic framework to measure project progress and performance in an objective manner.

Because Earned Value Management has the ability to combine measurements of scope, schedule, and cost into a single integrated system, this important project management methodology is able to provide accurate forecasts of project performance problems to the project management team and the project customer.

The EVMS process owner is the Jefferson Lab Project Management Office under the Chief Financial Officer organization.

EVMS Requirement

- **DOE Order 413.3B Program And Project Management For The Acquisition Of Capital Assets**
 - **Earned Value Management System**
 - An integrated set of policies, procedures and practices to objectively track true performance on a project or program. EVMS represents an integration methodology that is able to provide an early warning of performance problems while enhancing leadership decisions for successful corrective action.
 - Employ an Earned Value Management System (EVMS) prior to Critical Decision (CD)-2 for projects greater than or equal to \$20 million. **The system shall be compliant with ANSI/EIA-748B EVMS standard.**

Jefferson Lab

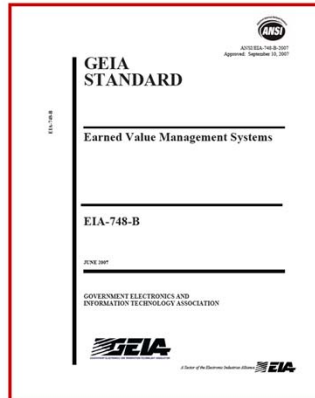

The requirement for an EVMS is prescribed in DOE Order 413.3B for projects with a Total Project Cost of \$20 million or greater.

The JSA EVMS has been certified by the Department of Energy as being compliant with the ANSI standard for Earned Value Management Systems.

EVMS Reference Documents

- **ANSI/EIA-748 Earned Value Management Systems**
 - **JSA Project Control System Manual**

Jefferson Lab

The JSA Project Control System Manual is the EVMS system description for Jefferson Lab and follows the guideline and criteria established by the ANSI Standard for Earned Value Management Systems.

ANSI/EIA-748 EVMS

- ANSI/EIA-748 prescribes **32 EVM guidelines** in five categories

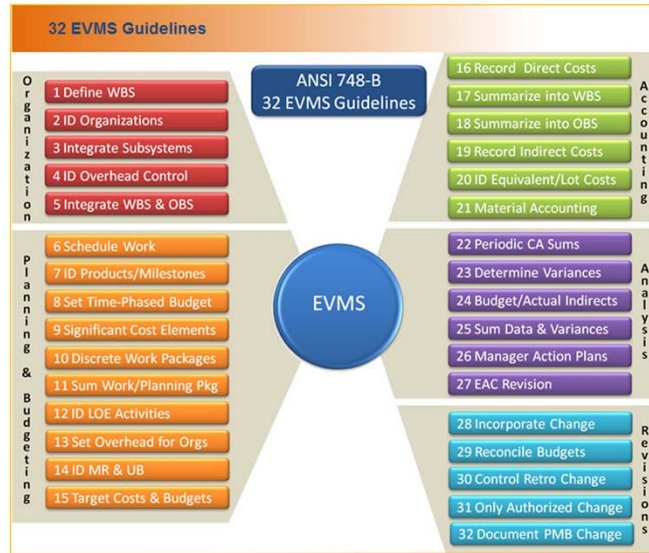

Jefferson Lab

The ANSI EVMS standard prescribes 32 Earned Value Management guidelines within 5 categories:

- Organization
- Planning, Scheduling and Budgeting
- Accounting Considerations
- Analysis and Management Reports
- and Revisions and Data Maintenance.

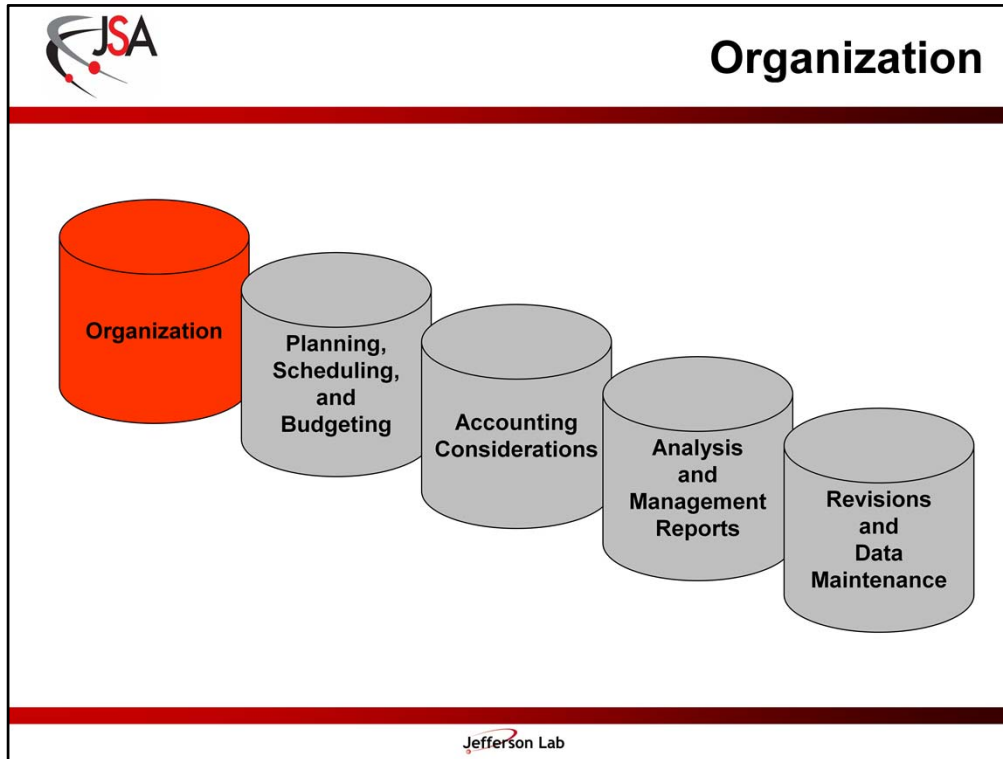

32 EVMS Guidelines

Jefferson Lab

Each Earned Value Management category within the ANSI EVMS standard has a series of guidelines that define the elements of that category. These 32 criteria are used to evaluate the completeness of an Earned Value Management System.

The first major element of an Earned Value Management System is Organization.

An organizational framework must be developed for the project prior to initiating the planning processes.

A well thought out project formation will lead to successful planning outcomes.

Jefferson Lab projects with an Earned Value Management System are organized with three key documents:

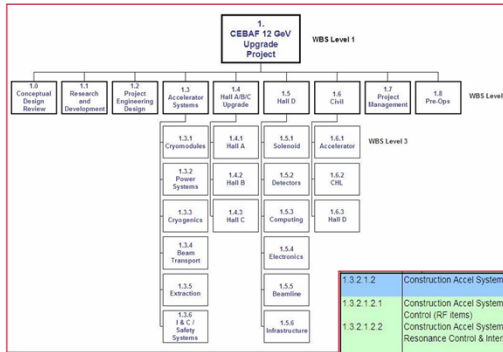

- the Work Breakdown Structure
- the Organizational Breakdown Structure

and

- the Responsibility Assignment Matrix.

Project WBS

• Work Breakdown Structure

...plus WBS Dictionary

1.3.2.1.2	Construction Accel Systems Power Systems RF Control	Roll up for Low Level RF System Equipment procurement, construction and installation for 80 cavities
1.3.2.1.2.1	Construction Accel Systems Power Systems RF Control Field Control (RF items)	Procure, build, test and install 80 LLRF control modules and support hardware for cavity gradient and phase control
1.3.2.1.2.2	Construction Accel Systems Power Systems RF Control Resonance Control & Interlocks (interlocks, tuner controls)	Procure, build and test and install Cavity tuning electronics and cavity interlocks Includes 80 Stepper motor controls, 80 Piezo electric tuner controls, 10 zones of cavity and system interlocks
1.3.2.1.2.3	Construction Accel Systems Power Systems RF Control Packaging/Interface (racks, crates)	Procure, build, test and install Racks & Interface for cavity LLRF tuning and interlock controls Includes 2 racks per zone, cable and interconnect hardware, auxiliary power supplies
1.3.2.1.2.4	Construction Accel Systems Power Systems RF Control CPU & Software	Procure, assemble, install and test LLRF embedded IOC and communications hardware. Develop and check software/EPICS interface for 10 zones Includes 11 PC104 processors and associated hardware per zone
1.3.2.1.2.5	Construction Accel Systems Power Systems RF Control Test Stand	Build offline test stands for LLRF controls calibration and testing
1.3.2.1.2.6	Construction Accel Systems Power Systems RF Control Master Oscillator	Element De-scoped
1.3.2.1.2.7	Construction Accel Systems Power Systems RF Control HPA Controls	Procure, assemble, test, and install HPA controller for 10 zones of new RF Controls

WBS is under formal Change Control

Jefferson Lab

The key framework for organizing a project is the Work Breakdown Structure with its associated WBS Dictionary.

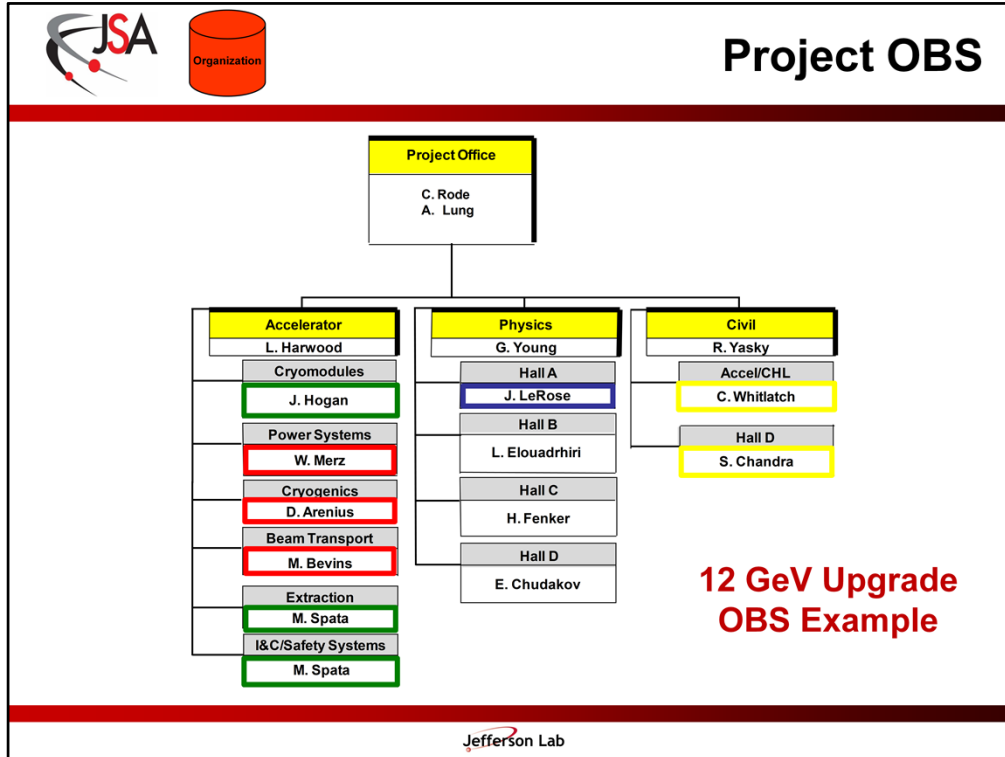

The WBS takes the form of a multi-level hierarchical framework depicting the overall project deliverable broken down into smaller system components.

Its purpose is to divide the project into manageable segments of work to facilitate planning, budgeting, estimating, work authorization, cost accumulation, and performance reporting.

A well designed WBS will incorporate all required project work and will not contain any work that falls outside the actual scope of the project.

A complete Work Breakdown Structure requires an associated dictionary to provide descriptive information for each WBS element. The WBS dictionary thoroughly describes the scope of each work element (including deliverables) identified in the WBS.

The WBS and the WBS dictionary are revised to reflect project changes via the Change Control process and are kept up to date during the life of the project.

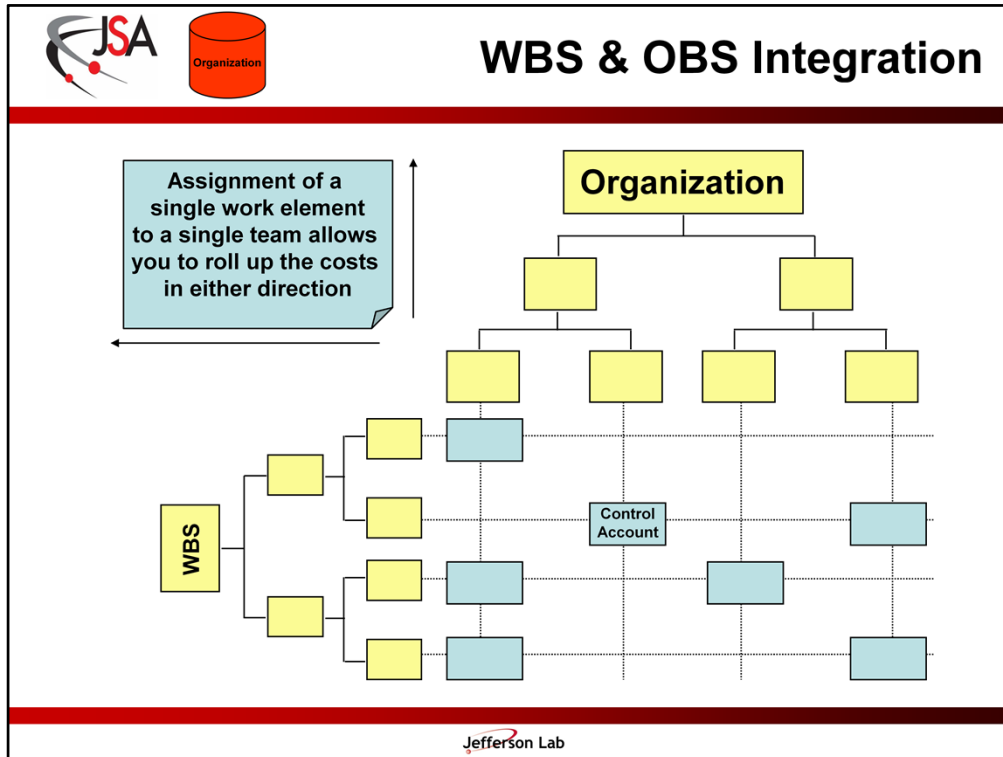

The project Organizational Breakdown Structure is a complementary arrangement to the Work Breakdown Structure.

The OBS defines the project authority and assigns work responsibilities.

Project leadership designs a hierarchical framework where unique work responsibilities can be established for each part of a project.

This framework establishes the formal authority relationships that exist among the various organizational team elements.

Integrating Jefferson Lab organizations with the Work Breakdown Structure ensures that all project work is accounted for and that each element of work is assigned to the level of responsibility necessary for planning, execution, tracking progress, accumulating costs, and reporting.

At selected levels of the WBS, the Project Manager establishes the project control accounts.

A control account is comprised of a WBS work element and a Control Account Manager assigned from a Jefferson Lab organization with the responsibility and authority to accomplish this work.

Control accounts represent a management control point where work performance can be measured via Earned Value methods.

The Responsibility Assignment Matrix is developed to correlate the relationship between the project work scope and an appointed authority responsible for accomplishing this work.

The matrix is created such that the intersection of a WBS element and an OBS element identifies the control account.

The RAM is “dollarized” by annotating the control account cell with the amount of project budget allocated to the control account.

The RAM is updated when baseline changes are made to the control account.

The next phase of an Earned Value Management System is Planning, Scheduling and Budgeting.

The main goal of the project planning effort is an integrated project schedule and budget.

Proper project planning ensures the amount of work to be accomplished, the time allotted to accomplish the project activities, and the resources required to complete the work scope are properly balanced.

The resultant resource-loaded schedule and initial project budget are validated and approved as an integrated project baseline which is endorsed by the project team as the Performance Measurement Baseline, a foundational element of Earned Value Management.

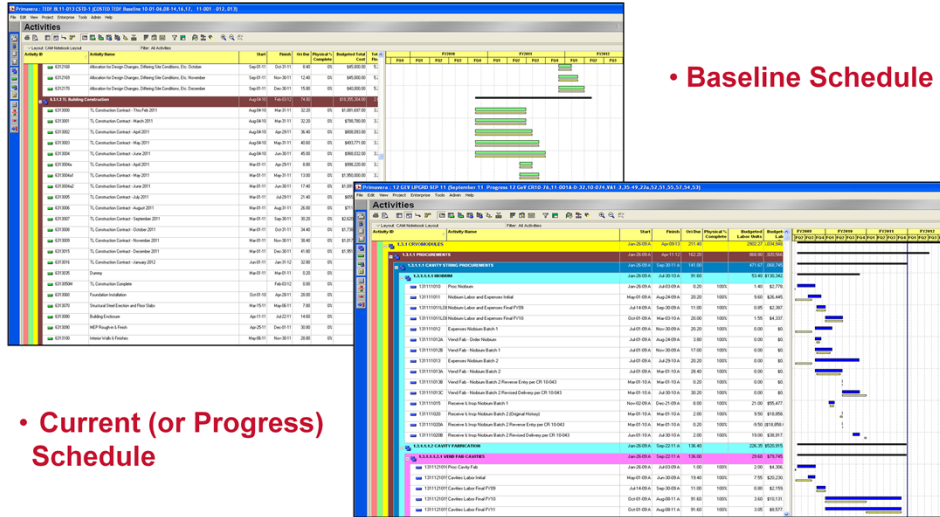

There are three key documents for the planning, scheduling and budgeting phase of a project:

- the Primavera P6 schedule
- the Control Account Plan
- and the Work Authorization Document

These documents describe the schedule and budget of the project plan and define the responsibility for accomplishing specific project work scope.

Project Schedules

The objectives of schedule planning are to generate a reasonable schedule of work that leads to project completion and to establish a schedule that, when loaded with resource elements, will result in an integrated project baseline.

The Primavera P6 scheduling system provides the requisite project management tools to plan and sequence project milestones and work activities, to assign resources to the activities, to monitor progress of activities toward project objectives, to forecast future schedule performance, and to provide the basis for earned value and performance calculations.

A baseline schedule and a current “progress” schedule are maintained for each project.

The baseline schedule constitutes the performance standard against which actual progress is compared.

A current (or “progress”) schedule is derived from the baseline schedule and is used as a working tool for evaluating schedule plans and projecting future progress.

The current schedule is kept up to date with actual start/finish dates and measured percent complete on each activity.

Schedule progress is nominally measured once a month.

By evaluating the current schedule against the baseline schedule, the project team can assess how the project is progressing compared to the baseline plan.

Project Costs

- **Cost Estimating (Primavera P6)**
 - Labor
 - Procurements
 - Expenses
 - Supplies & Material
- **Cost Budgeting (Primavera Cost Manager)**
 - Aggregate project elements
 - Activities to Work Packages to Control Accounts
 - Total Cost Baseline
 - Includes Indirect \$ plus Escalation
 - Performance Measurement Baseline

Cost planning begins with the development of a cost estimate for all authorized work that eventually leads to the establishment of the project budget.

The budgeting process establishes a means for developing and tracking the cost goals for all contractually authorized work.

Resources, such as Labor, Procurement, and Expenses, are added to appropriate activities in the Primavera P6 scheduling system.

Resource data from Primavera P6 are accessed by the Primavera Cost Manager program where the resource direct dollars are properly burdened and escalated.

Once the cost estimates are endorsed by the project management team, the aggregate control accounts then become the Performance Measurement Baseline.

Contingency / Management Reserve

	Contingency	Management Reserve	Total
TEC	\$14,871k	\$771k	\$15,642k
OPC	\$2,556k	\$1k	\$2,556k
TPC	\$17,427k	\$772k	\$18,199k
		thru CR12-035	\$18,198k
		cross check	\$0k
		%	22.6%

- Contingency \$\$ controlled by DOE
- MR \$\$ controlled by Project Manager
- Tracked in Change Control Log

During development of the project cost plan, reserve funds may be identified to provide budget that covers future risk elements to the project.

These funds are part of the Total Project Cost but reside outside the Performance Measurement Baseline.

Contingency is normally developed "bottoms-up" from a risk assessment of individual work elements within the project WBS.

Funds held in the contingency account are nominally controlled by the project customer.

A portion of the reserve funds, designated management reserve, may be allocated to the project manager for his approval authority.

The release of contingency and management reserve funds is managed through the change control process.

Transactions for these accounts are documented in the project baseline change control log.

Work Authorization Document

- CAMs receive authorization to commit and expend project resources
- WAD issued and signed before work begins
- Updated with Change Control process

A work authorization system is required during the project execution phase to control the flow of work to be accomplished within the authorized project budget.

This formal procedure is used to sanction project work with limits being imposed on managers in their authority to commit and expend resources that will be charged to the project.

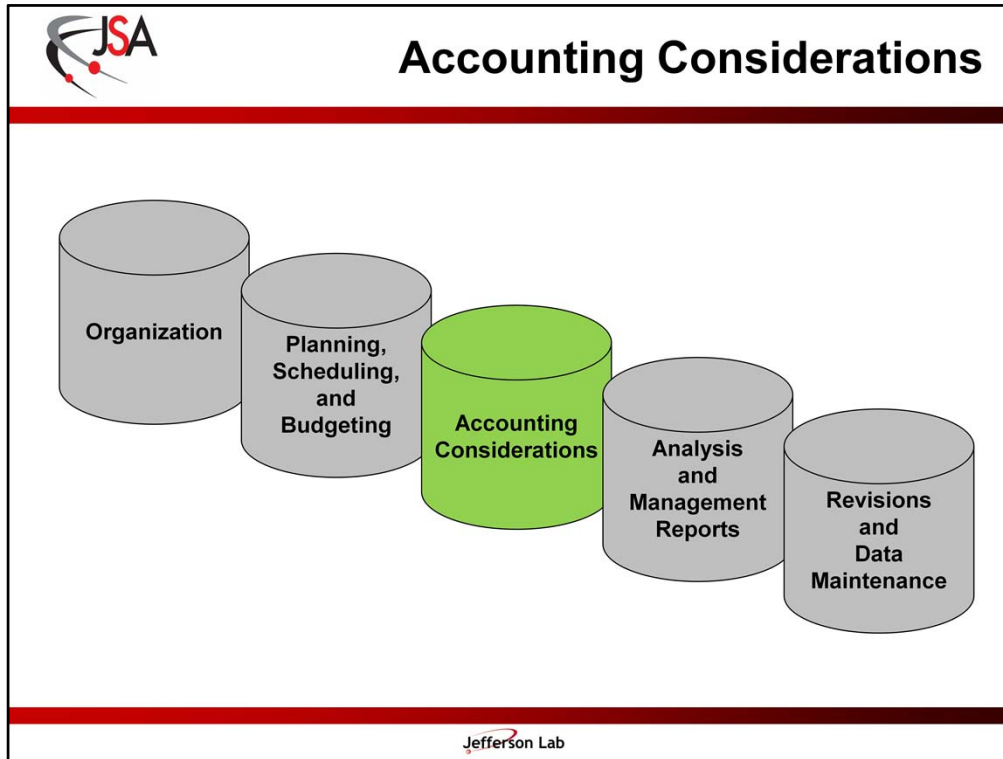

These limitations provide assurance to the Project Manager that no work is authorized unless it has been properly planned and budgeted.

Work authorization is the specific mechanism where Control Account Managers receive the authority to begin the work defined in their validated Control Account Plans.

The WAD contains the control account information, a list of associated work packages, approval signatures, and acceptance signature of the Control Account Manager.

The signed WAD empowers the Control Account Manager to implement the Control Account Plan.

The approved control account can only be changed with appropriate change approval. WADs shall be updated to reflect each approved change request.

The third element of an Earned Value Management System is Accounting Considerations.

The purpose of an accounting system is to collect the actual costs incurred by a project, which when compared with Earned Value data, can provide project management with the status of a project's budget.

Accurate cost accounting is essential to gaining a true understanding of how a project is performing with regards to the Performance Measurement Baseline.

Accounting Considerations

- **Record project direct costs as incurred**
- **Record indirect costs as allocated to the project**
- **Provide accurate and timely cost reports**

The key objective of an accounting system is to record project direct costs within the appropriate WBS element and charge code.

This allows the direct costs to be summarized at the proper control account level.

The accounting system must also allocate any project indirect costs to the appropriate WBS element.

To aid the project team in managing the project, cost reports must be generated in an accurate and timely manner.

Project Costs

- Actual costs are updated on a daily basis
- Available to CAMs via JLab Management Information System

Actual costs for the various JLab functions and projects are updated each day.

Cost data can be accessed using the Status Report in the JLab Management Information System.

The fourth EVMS category is concerned with generating accurate project performance data and conducting proper analysis of this data to forecast schedule and costs problems.

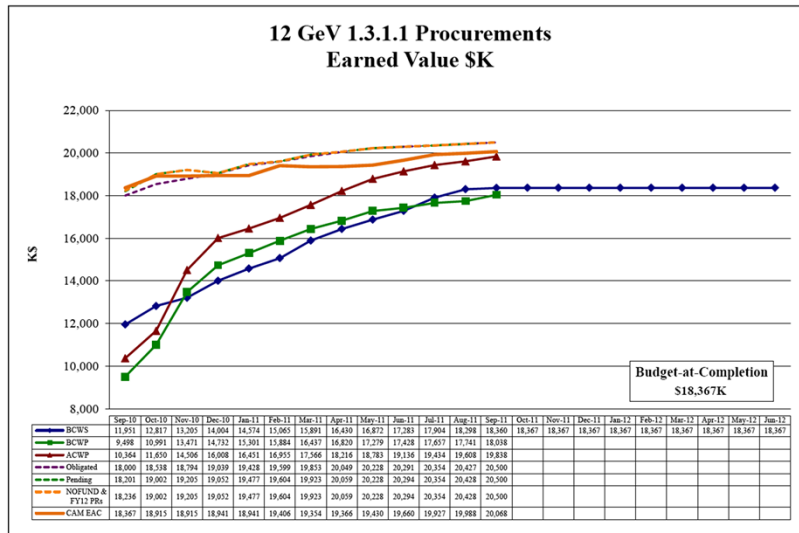

Management reports and charts are developed that will aid project personnel in deciding the proper path forward.

The objectives of project performance analysis and reports are:

- to provide schedule, cost, and scope reports to the project management team, usually on a monthly basis;
- and to analyze the actual project performance against the established project baseline.

Earned Value Management Data

Jefferson Lab

There are three elementary project data that form the basis of Earned Value Management:

- Budgeted Cost of Work Scheduled (or Planned Value)
- Budgeted Cost of Work Performed (or Earned Value)
- and
- Actual Cost of Work Performed (or Actual Costs)

These project data are tracked on a monthly basis as well as a cumulative basis.

EVM Performance Measurement

- **Schedule Variance**
= Earned Value (BCWP) – Planned Value (BCWS)
- **Cost Variance**
= Earned Value (BCWP) – Actual Costs (ACWP)
- **Schedule Performance Index**
= Earned Value (BCWP) / Planned Value (BCWS)
- **Cost Performance Index**
= Earned Value (BCWP) / Actual Costs (ACWP)

Jefferson Lab

The three project data are used to express the main performance measurement elements.

Schedule Variance is calculated by subtracting Planned Value from Earned Value while the Schedule Performance Index is Earned Value divided by Planned Value.

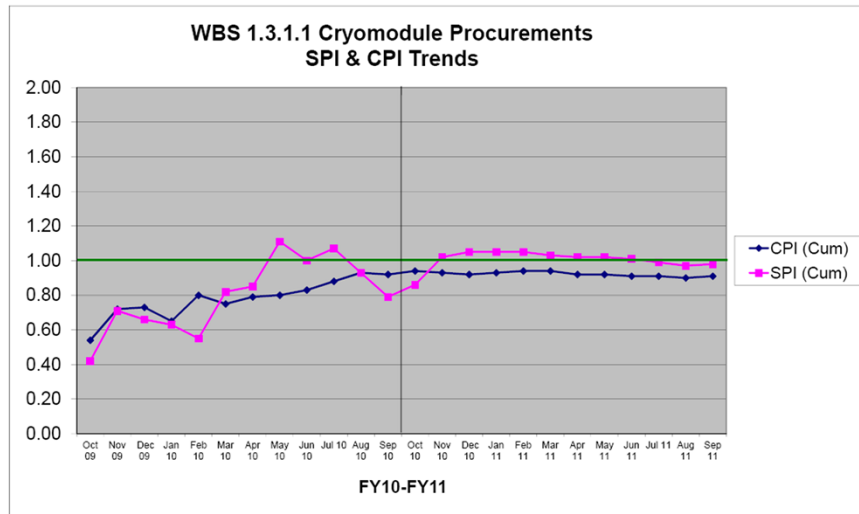

The cost numbers are calculated in a comparable manner.

The performance measurement elements are calculated for each control account and at other designated WBS levels.

They provide the Control Account Managers with an indication of how their control accounts are performing as measured against the established Performance Measurement Baseline.

SPI & CPI Trends

Jefferson Lab

One of the useful tools is the Schedule and Cost performance index trend tracking charts.

These trends readily tell the Control Account Manager if the control account performance is trending toward the baseline plan or not.

It also tells the CAM if any corrective action taken is getting the control account back on track.

Variance Analysis Report

Variance Thresholds

For Control Accounts:
Yellow: Index <.9 / >1.1 or Variance > \$25K
Red: Index <.8 / >1.2 and Variance > \$50K

Thresholds			
SV	SPI	CV	CPI

	1.10		1.10
50	0.80	50	0.80
	1.20		1.20

12 GeV Upgrade VARIANCE ANALYSIS REPORT

WBS: 1.2.3 PED - Hall D
 Cost Account Manager: E. Aschmayer
 For Period Ending: 31 Aug 07

Schedule Flag	SCHEDULE FLAG				COST FLAG			
	(S1)	(S2)	(S3)	(S4)	(C1)	(C2)	(C3)	(C4)
Released or in Order (other than WFA & CP)	Planned Value	Earned Value	Schedule Variance	Schedule Perform.	Actual Value	Cost Variance	Cost Perform.	Cost
	BCWS	BCWP	SV	SP	BCAP	ACWP	CV	CP
Month of Lag or	65	28	-37	0.43	28	38	-8	0.80
Completion	421	322	-99	0.77	322	307	-14	0.93

1. Cause (Address Variance Indicators)
 SV: The schedule variance has 2 sources. The first one is that we lost our contract designer in July and have not been able to find a replacement yet. The second source comes from the fact that we have not yet been able to award a contract for design work on the target to an outside group as it turned out to be more complicated to define all the needed specific criteria meeting a 100% design.
2. Proposed Solutions (Corrective Actions)
 SV: For the first source the corrective action was to hire a designer. This has been accomplished, and he will start mid-September. The second source will correct itself as soon as the contract is awarded.
3. Impact on Project Cost Schedule
 None
4. Comments

Cost Account Manager: E. Aschmayer
 Project Manager: W. Brooks
 L. Warren Fink for C. Rode

Each project defines the schedule and cost performance thresholds for when a Variance Analysis Report is due.

If a control account has breached the Red Flag variance and performance index thresholds, then the Control Account Manager is required to complete the VAR form.

It is essential that the correct cause of the variance is identified such that any initiated corrective action will be successful in progressing the control account toward planned baseline performance.

Estimate at Completion

- **EAC = Actual Costs (AC) + Estimate To Complete (ETC)**
- **EAC = AC + (BAC – BCWP)**
- **Use of Performance Indices (SPI & CPI)**
 - $EAC^1 = BAC / CPI$
 - $EAC^2 = AC + \text{Budgeted Cost of Work Remaining} / CPI$
 - $EAC^3 = AC + BCWR / (.5CPI + .5SPI)$
 - $EAC^4 = AC + BCWR / (CPI * SPI)$
 - Use as cross-check for detailed bottoms-up EAC

- **Variance At Completion (VAC) = BAC - EAC**

Jefferson Lab

One of the important numbers to a Project Manager is the Estimate At Completion, or EAC.

The EAC is the actual cost to-date plus an objective estimate of costs for the remaining authorized work on the project.

There are several methods of developing an Estimate To Complete, or ETC.

The project Control Account Managers can formulate an ETC for their control accounts by conducting a bottoms-up cost assessment of their remaining project work.

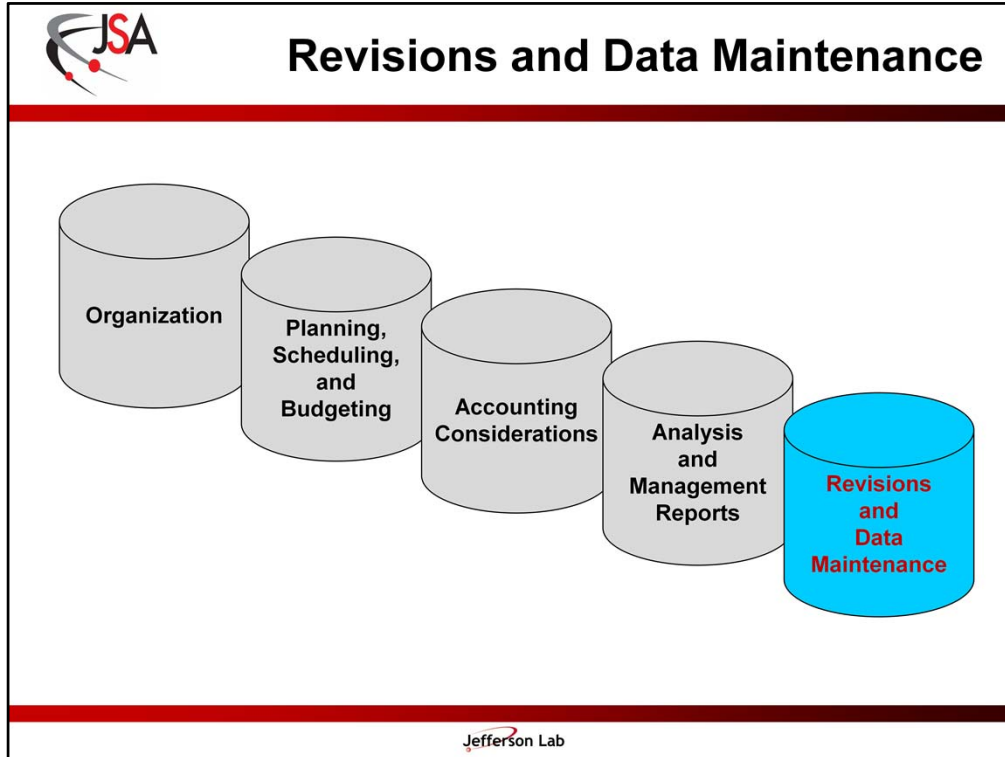

All control account estimates are summed to produce a project EAC.

An ETC can also be calculated by subtracting the to-date cumulative value of Budgeted Cost of Worked Performed from the project's Budget At Completion.

Additionally, there are methods for calculating an EAC that involve using project EVM performance data.

The calculated EAC can then be used to cross-check against the EAC derived from the CAMs' assessment.

With an EAC in hand, the projected Variance at Completion can be established by subtracting the Estimate At Completion from the Budget At Completion.

The final EVMS category is Revisions and Data Maintenance.

Sometimes the best project plans need to be revised to keep them current and relevant.

This portion of the presentation represents the process of making changes to the Performance Measurement Baseline and maintaining the integrity of the project EVMS data.

Revisions and Data Maintenance

- Provide **timely approval/rejection** of change requests
- **Incorporate approved changes** into the PMB
- **Reconcile** budget changes to authorized scope changes
- **Control retroactive changes**

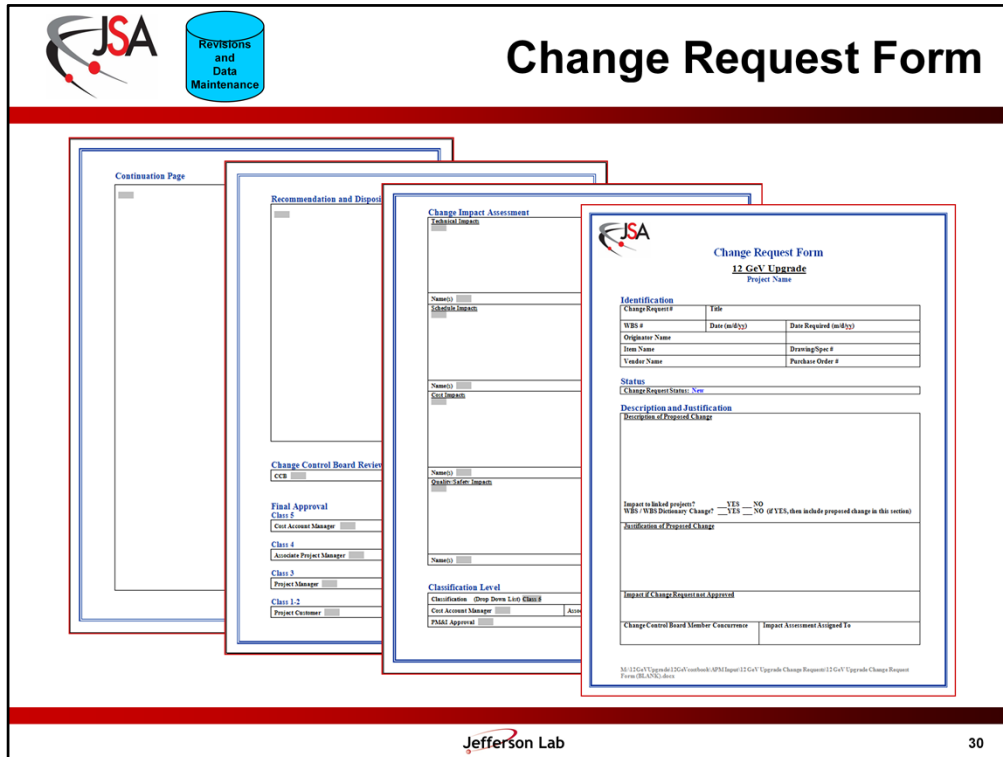

Jefferson Lab

The Change Control Process is used to establish, analyze, communicate, and record approved changes to the project baseline.

Baseline changes may occur as a result of contractual modifications, application of undistributed budget, use of contingency/management reserve funds, replanning, or formal reprogramming.

The key objectives of the Change Control process are:

- Provide approval (or rejection) of all change requests in a timely manner
- Incorporate all approved changes into the Performance Measurement Baseline
- Reconcile current budgets to prior budgets in terms of changes to authorized work scope
- And Control retroactive changes to records pertaining to work performed that would change previously reported amounts for actual costs, earned value, or budgets.

The Change Request form is used to document the proposed baseline change.

The originator of the Change Request describes the proposed change and provides a justification for its approval.

Once a member of the project Change Control Board has concurred with the proposal, assessments are conducted on technical, schedule, cost and quality and safety impacts of the proposed change.

The first step in the Change Request process is to develop a What-If schedule with the proposed revisions to activity dates, links, and resources in the Primavera P6 scheduling system.

This will generate a new Budgeted Cost of Work Scheduled (or Planned Value) curve for the control accounts affected by the change.

Budget changes to control accounts in the P6 scheduling system are incorporated using direct dollars.

Burden and escalation factors will be added to the affected control accounts via the Cost Manager EVM system.

A Change Request Log is maintained to track the status of project change requests.

The Log is kept current as a change request progresses through the change control process.

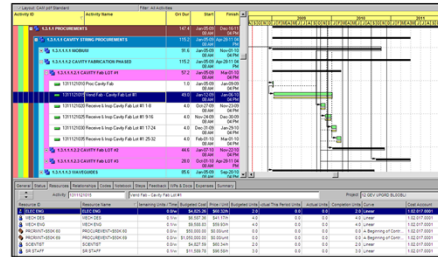

A Contingency and Management Reserve Log is part of the Change Request Log to track the status of these two reserve budgeting categories.

Upon the change request approval requiring additional budget, dollars are transferred from these reserve funds to the appropriate control account in the Performance Measurement Baseline.

Implementation Documentation

- Both baseline and current “progress” schedules are updated
- Performance Measurement Baseline (PMB) updated in Cost Manager

Once the change request has been approved, the baseline documents are formally updated.

Both the baseline and the current “progress” schedules are updated to reflect the approved changes.

And the Performance Measurement Baseline is updated in the Cost Manager EVM system.

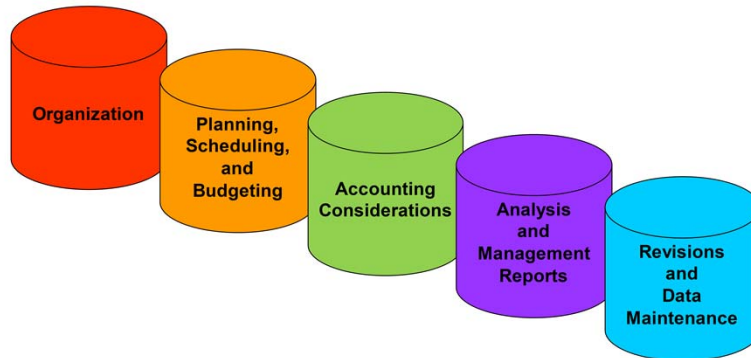

Integrity of the Performance Measurement Baseline is very important.

Changes to historical EVM data are not made; any errors to be corrected are done in the current month, not in the month they occurred.

Earned Value Management System

In Summary...

Jefferson Lab

JSA's Earned Value Management System is a valuable tool and methodology for JLab project teams to use as they organize, plan and execute their projects.

By adhering to the standard practices as outlined in this presentation, the probability of successful project outcomes is enhanced.

You have now completed your annual refresher training on EVMS.

Any follow-on questions pertaining to Earned Value Management can be addressed to Dennis Miner, Project Management Office at miner@jlab.org or extension 7281.
