Beyond DVCS: Timelike Compton Scattering

$$\gamma p \rightarrow \gamma^* p$$

TCS is the time-reversal symmetric process to DVCS:

The incoming photon is real, the outgoing photon is highly virtual and decays in a pair of leptons

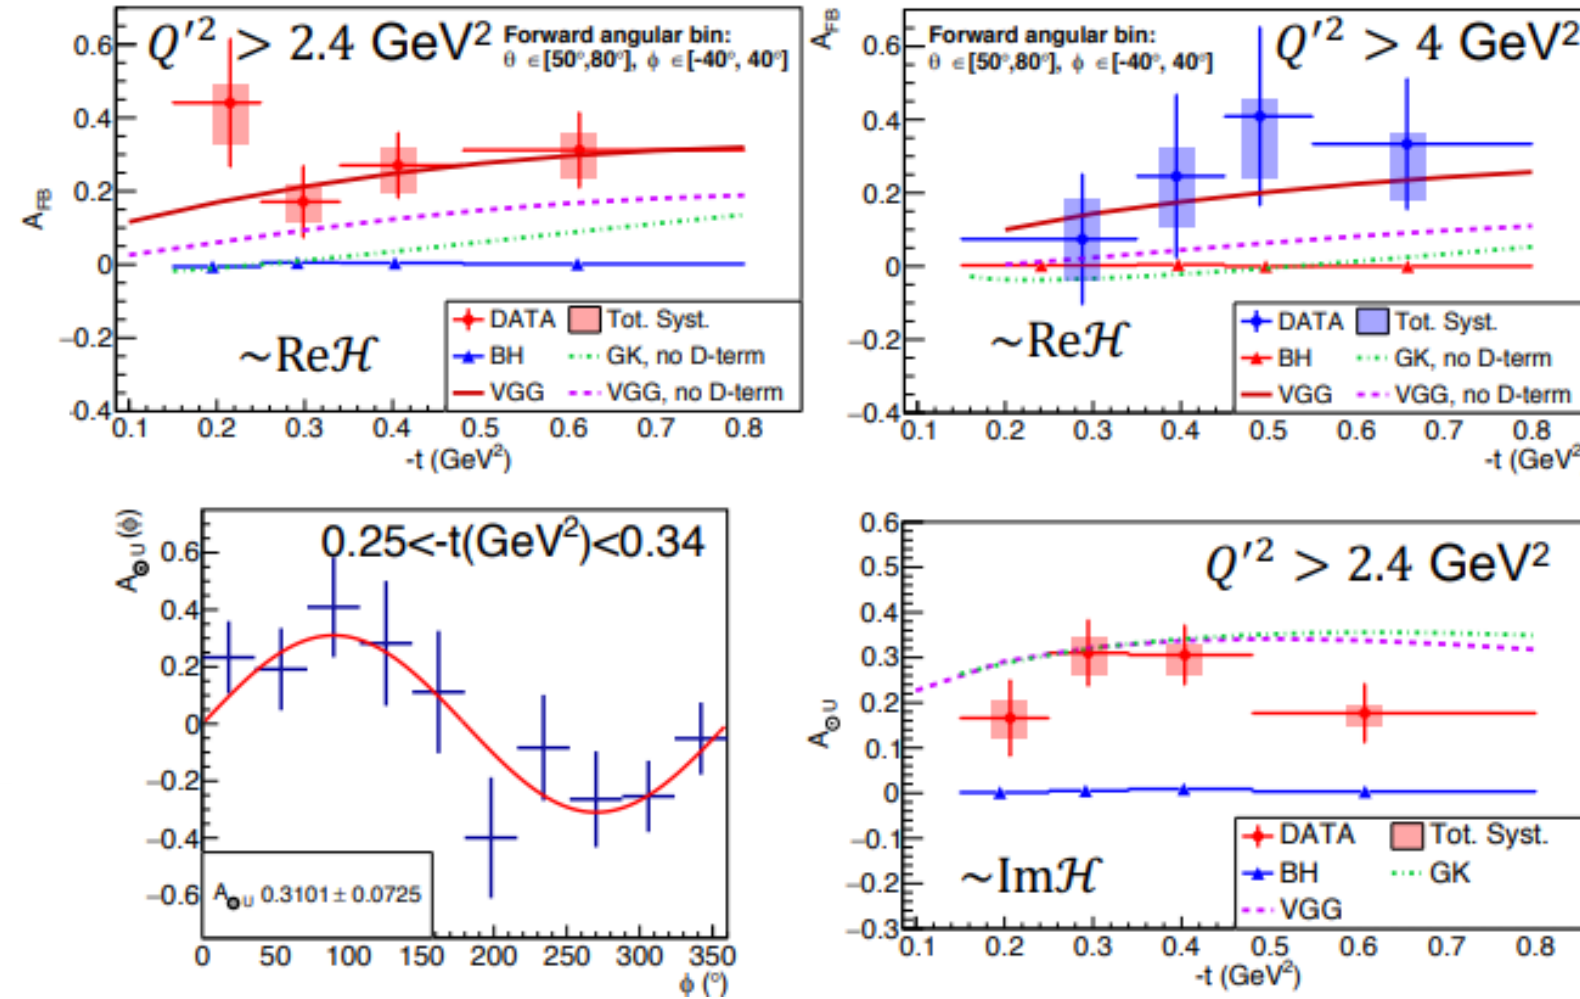

$$\frac{d\sigma_{INT}}{dQ'^2 dt d(\cos \theta) d\varphi} = -\frac{\alpha_{em}^3}{4\pi s^2} \frac{1}{-t} \frac{M}{Q'} \frac{1}{\tau\sqrt{1-\tau}} \frac{L_0}{L} \left[\cos \varphi \frac{1 + \cos^2 \theta}{\sin \theta} \text{Re} \tilde{M}^{--} \right. \\ \left. - \cos 2\varphi \sqrt{2} \cos \theta \text{Re} \tilde{M}^{0-} + \cos 3\varphi \sin \theta \text{Re} \tilde{M}^{+-} + O\left(\frac{1}{Q'}\right) \right] \\ - \lambda \frac{\alpha_{em}^3}{4\pi s^2} \frac{1}{-t} \frac{M}{Q'} \frac{1}{\tau\sqrt{1-\tau}} \frac{L_0}{L} \left[\sin \varphi \frac{1 + \cos^2 \theta}{\sin \theta} \text{Im} \tilde{M}^{--} \right. \\ \left. - \sin 2\varphi \sqrt{2} \cos \theta \text{Im} \tilde{M}^{0-} + \sin 3\varphi \sin \theta \text{Im} \tilde{M}^{+-} + O\left(\frac{1}{Q'}\right) \right].$$

Incoming photon polarization

First-ever measurement of Timelike Compton Scattering (CLAS12)

$$\gamma p \rightarrow \gamma^* p \rightarrow (e') e^+ e^- p$$

- Quasi-real photo-production ($Q^2 \sim 0$)
- The beam helicity asymmetry of TCS accesses the imaginary part of the CFF in the same way as in DVCS and probes the universality of GPDs
- The forward-backward asymmetry is sensitive to the real part of the CFF \rightarrow direct access to the Energy-Momentum Form Factor $d_q(t)$ (linked to the D-term) that relates to the mechanical properties of the nucleon (quark pressure distribution)
- This measurement proves the importance of TCS for GPD physics.
- Limits: very small cross section \rightarrow high luminosity is necessary for a more precise measurement
- Imminent doubling of statistics thanks to data reprocessing with improved reconstruction

DDVCS: the gateway to the full kinematic mapping of GPDs

Thanks to the virtuality of the final photon, Q'^2 , **DDVCS** allows a unique direct access to GPDs at $x \neq \pm\xi$, which is fundamental for their modeling

Experimental challenges:

- Small cross section (300 times less than DVCS)
- Need to detect muons

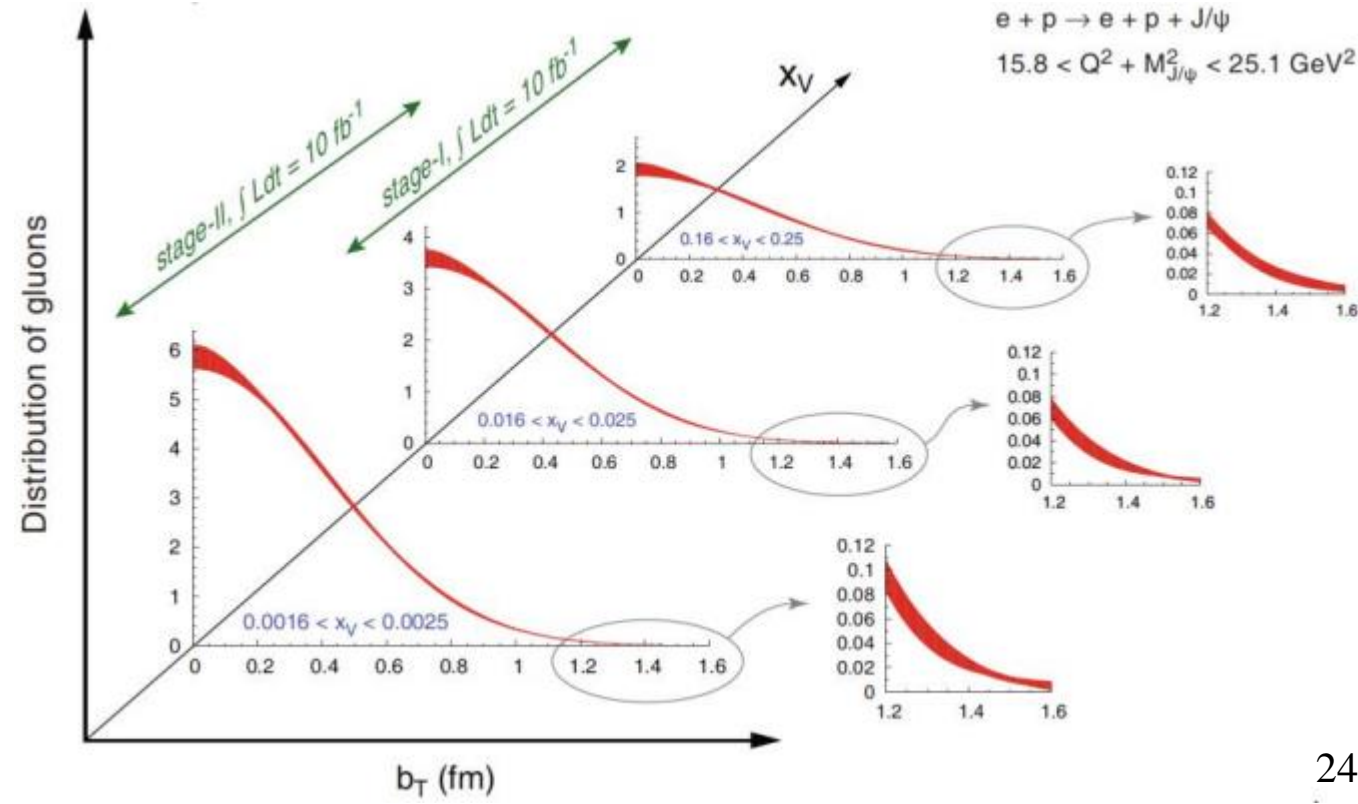

- Possible CLAS12 upgrade (LOI):
“ μ CLAS12” for DDVCS and J/ψ
 $ep \rightarrow e'p'\mu^+\mu^-$ at $L \sim 10^{37} \text{ cm}^{-2}\text{s}^{-1}$

The future: GPDs with ePIC@EIC - sea quarks and gluons in 3D

Gluon tomography

Conclusions/outlook

- ✓ GPDs are a unique tool to explore **the structure of the nucleon**:
 - **3D** quark/gluon **imaging** of the nucleon
 - **orbital angular** momentum carried by quarks
 - **pressure** distribution
- ✓ Fitting methods allow to **extract CFFs (\rightarrow GPDs) from DVCS** observables \rightarrow several **p-DVCS** and **n-DVCS observables** are needed, covering a **wide phase space**
- ✓ A lot of **results** on proton-DVCS observables were obtained from **HERMES**, **CLAS** and **Hall-A** at 6 GeV
 - \rightarrow First **tomographic interpretations** of the quarks in the **proton** from DVCS
 - \rightarrow Insight in the **pressure distribution** in the proton
- ✓ JLab@12 GeV is **the optimal facility** to perform GPD experiments **in the valence region**
- ✓ DVCS and DVMP experiments on both **proton** and **neutron** (polarized and unpolarized) are ongoing in **3 of the 4 Halls at JLab@12 GeV**, and **a wealth of results** are being released:
 - \rightarrow **quarks' spatial densities, GPD flavor separation, quarks' orbital angular momentum, chiral-odd GPDs, transition GPDs,...**
 - \rightarrow **JLab upgrade perspectives (positron beam, higher luminosity and energy) pave the road to the completion of the GPD program in the valence regime**
 - \rightarrow **Longer-term future: EIC, to study the gluonic structure of the nucleon and gluon GPDs**

DVCS with polarized positrons beam at JLab

The importance of beam-charge asymmetry for DVCS was highlighted by the pioneering HERMES experiment

Disposing of a polarized positron/electron beams at JLab → new observables = different sensitivities to GPDs

Beam Charge Asymmetries proposed to be measured at CLAS12:

- The unpolarized beam charge asymmetry A_C^{UU} , which is sensitive to the real part of the CFF → D-term, forces in the proton
- The polarized beam charge asymmetry A_C^{LU} , which is sensitive to the imaginary part of the CFF
- The neutral beam spin asymmetry A_0^{LU} , which is sensitive to higher twist effects

This observable has a strong impact on the extraction of $\text{Re}E$. This was verified via local fits to the projections of approved CLAS12 nDVCS measurements **with** and **without** BCA

Projections (VGG) for the BCA, for various values of J_u, J_d

0.3, 0.1; **0.2/0.0**; **0.1/-0.1**; 0.3/-0.1
