# WHAT DOES THAT ALL MEAN?

## Physics Project

- GPDs
- $x$ -dependence: parton momentum fraction
- Exclusive Photoproduction

## Data Science Project

- Frequentist vs Bayesian
- Why should we redo the JPAC model?

# GLUEX

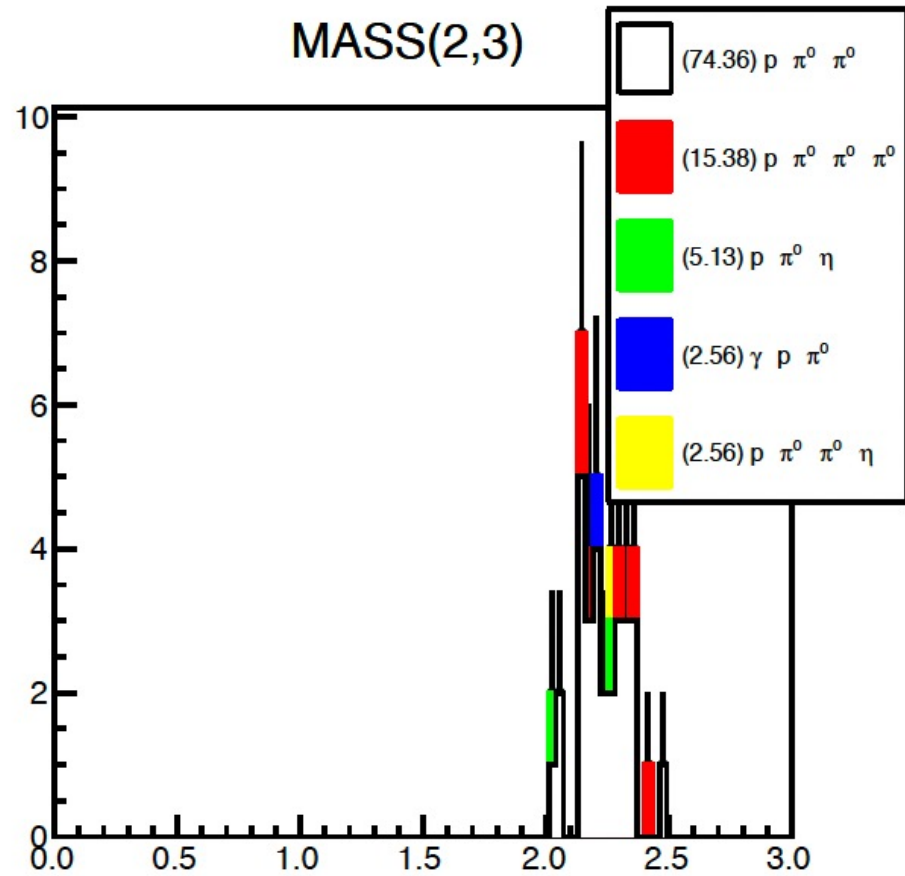

# SINGLE DIFFRACTIVE HARD EXCLUSIVE PROCESS:

$$\gamma P \rightarrow \pi^0 \gamma P \rightarrow \gamma \gamma \gamma P$$

Jian-Wei Qiu and Zhite Yu

# PROBLEM

- $\gamma p \rightarrow \pi^0 \gamma p \rightarrow \gamma \gamma \gamma p$
- 3 or 4 photons?
- We can't exclude what we don't know exists
- Transverse Momentum Cut

# WHAT'S SO SPECIAL ABOUT BAYESIAN STATISTICS?

Bayesian Statistics allows us to update our beliefs as new information becomes available

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$

Posterior      Likelihood      Prior

Marginal

A = Hypothesis

B = Evidence

Priors: a,b,c

Model:  $y = a+bx + \dots$

Bayesian Framework

$Y_{obs}$

Posterior

# CHANNELS

1C: Only  $J/\psi$   $p$  interactions included

2C: Includes an intermediate channel

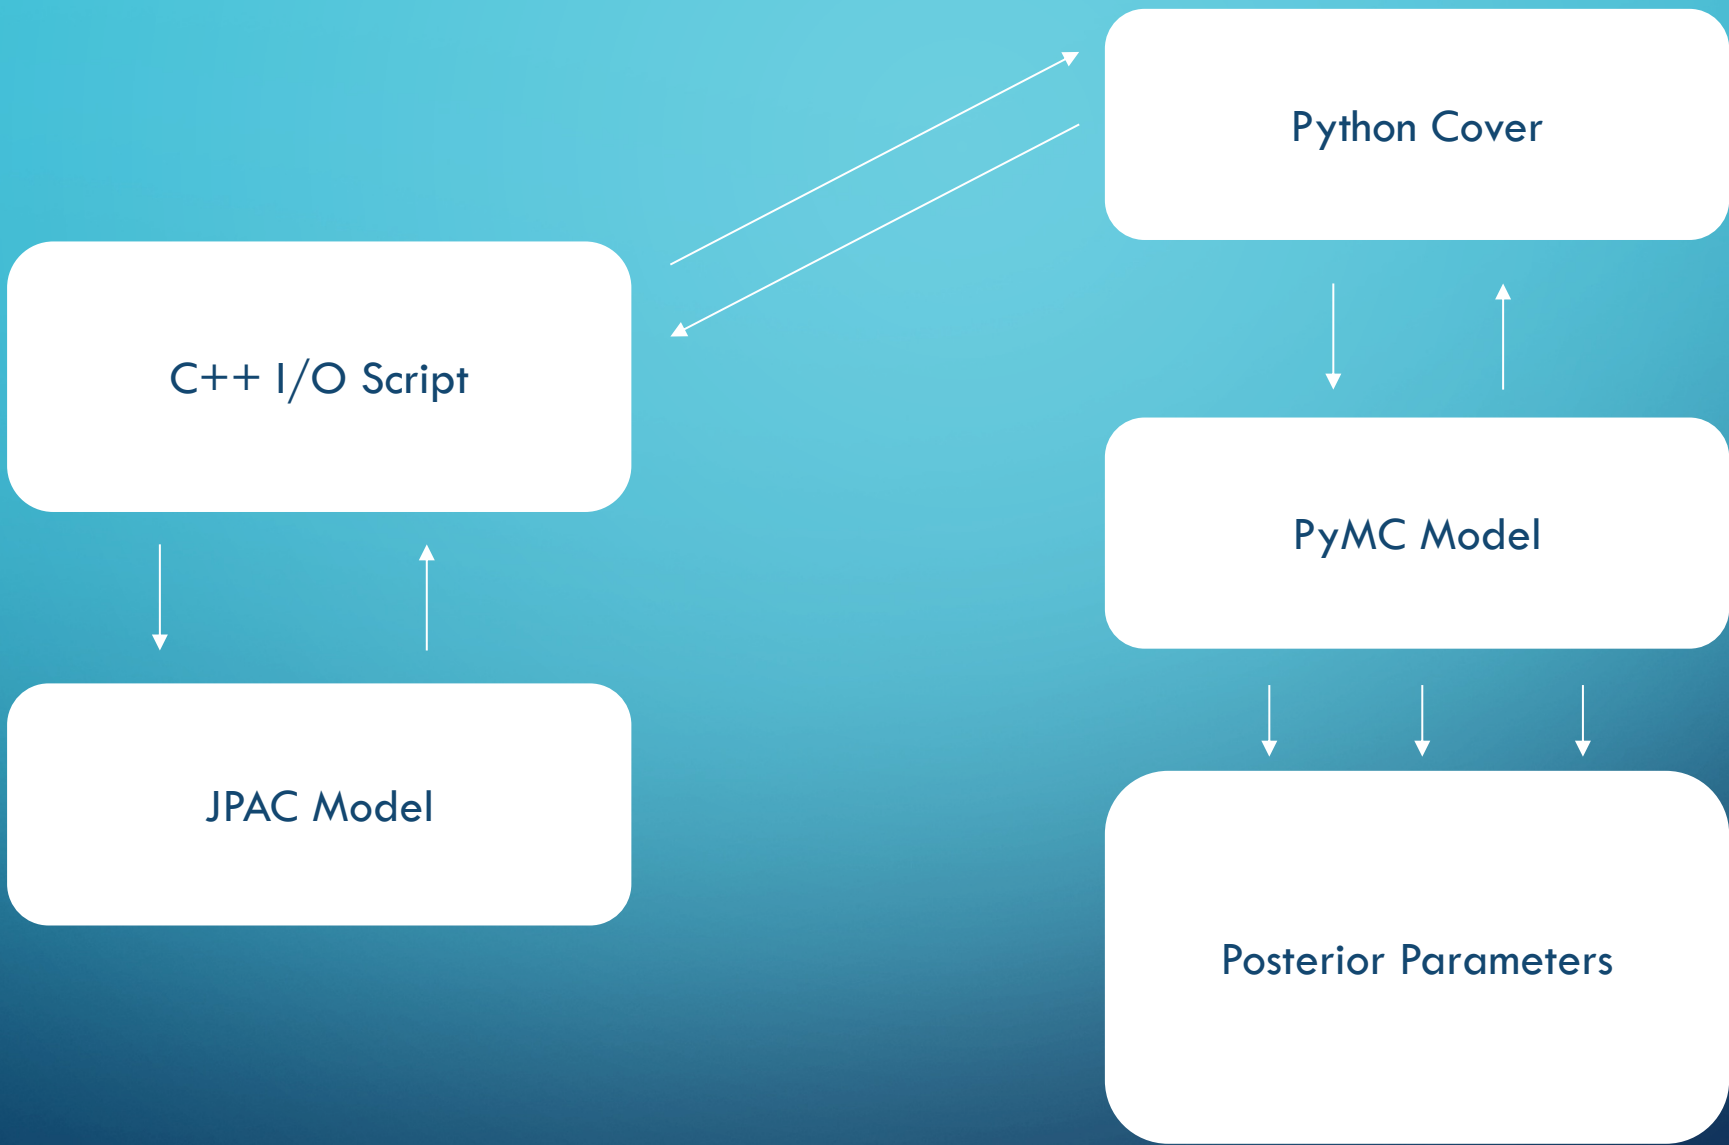

3C: Resonant and Non-Resonant, includes both intermediate channels

# BAYESIAN UNCERTAINTY QUANTIFICATION OF THE JPACPHOTO MODEL OF $\gamma p \rightarrow J/\psi p$

# MODEL: 1C

# FUTURE WORK

$$\gamma p \rightarrow \pi^0 \gamma p$$

- Adding new MC simulations, cuts
- Model  $\rightarrow$  elimination/estimation of the contribution of background in the data

$$\gamma p \rightarrow J/\psi p$$

- Expand upon model to include Gaussian Process approach to area between data points
- Include uncertainty in model
- Expand model to other channels
