# Lepton ID

- Enhance Lepton identification to prevent pion contamination.
- Uses machine learning models, trained on simulation.
- Validation on data showed that by retaining around 90% of leptons in the samples, the background can be reduced by a factor of 10.
- After the training we obtain for each model a weight file that containing the results of the training.

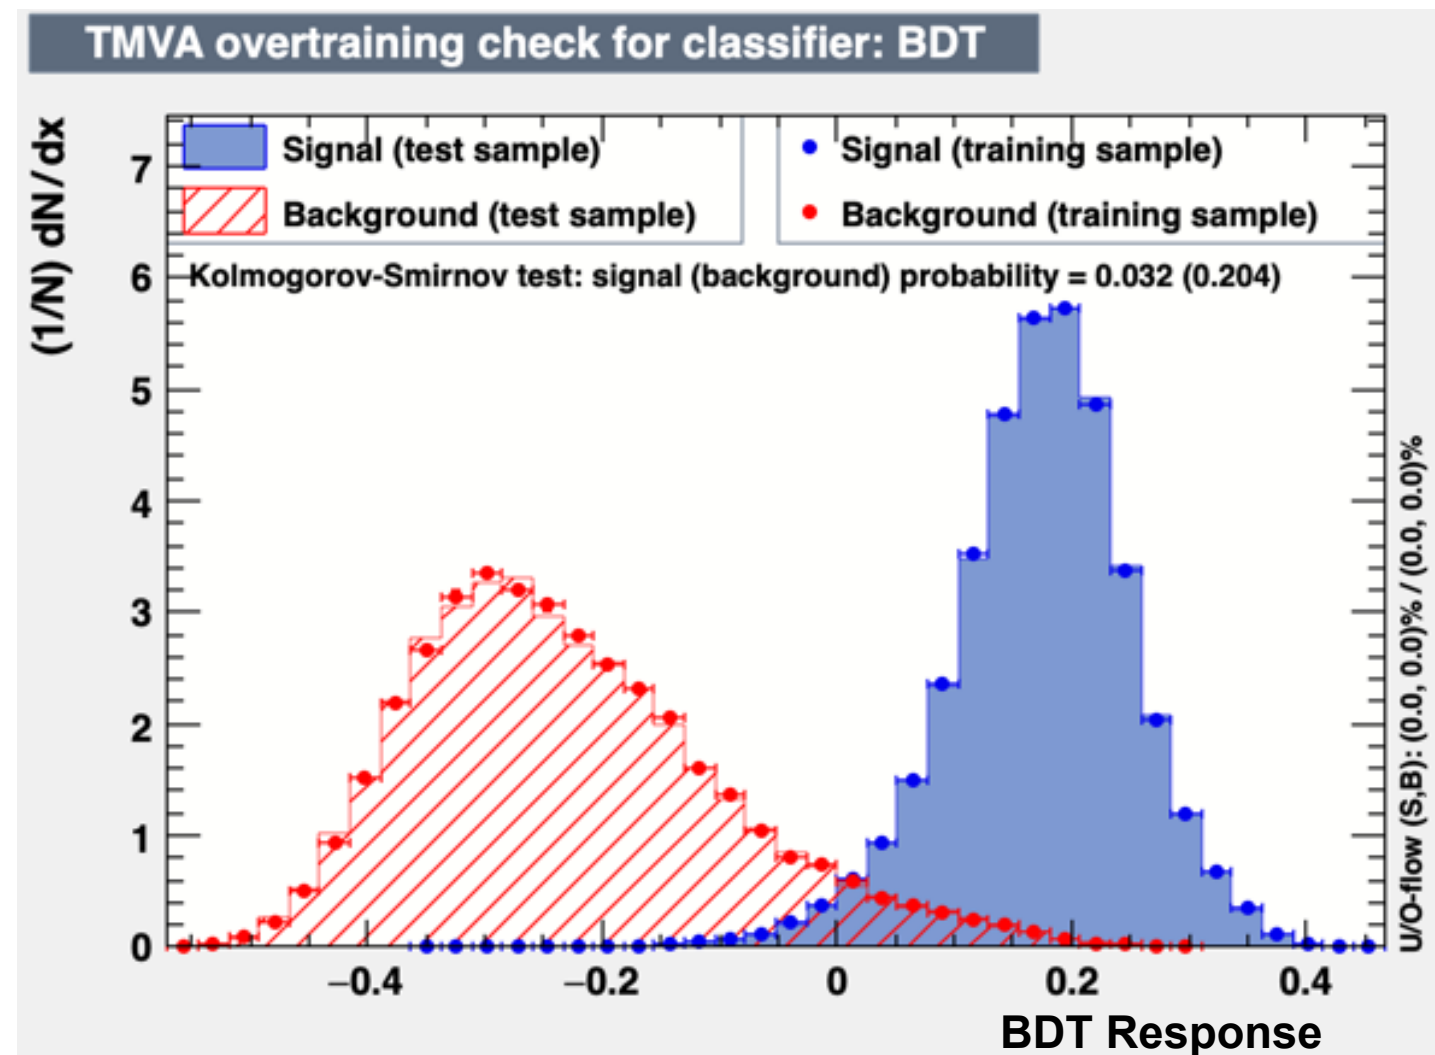

# Lepton ID

- Classifiers:  $e^+$  and  $e^-$  identification on each Pass2 RGA configuration:
  - Fall 18 Inbending (10.6 GeV)
  - Fall 18 Outbending (10.6 GeV)
  - Spring 19 Inbending (10.2 GeV)
- Methods tested: Multilayer Perceptron (MLP) and Boosted Decision Trees (BDT, default)
- Variables used:  $P$ ,  $\theta$ ,  $\phi$ , SF and  $m_2$  of PCAL, ECIN and ECOUT.
- 6 and 9 (default) Variable models.

# Lepton ID

- The algorithm reads REC::Particle and REC::Calorimeter data banks for particles with PID=11/-11
- For each particle, it saves the necessary variables and then calls the TMVA reader.
- The output is a “score” value.
- We can apply a cut to discard any particles under certain value. Default cut is 0.0

```
//Get TMVA reader
TMVA::Reader *readerTMVA = new TMVA::Reader( "!Color:!Silent" );
// Create a set of variables and declare them to the reader
Float_t P, Theta, Phi, PCAL, ECIN, ECOUT, m2PCAL, m2ECIN, m2ECOUT;

readerTMVA->AddVariable( "P",&P );
readerTMVA->AddVariable( "Theta",&Theta);
readerTMVA->AddVariable( "Phi",&Phi);
readerTMVA->AddVariable( "SFPCAL",&PCAL);
readerTMVA->AddVariable( "SFECIN",&ECIN);
readerTMVA->AddVariable( "SFECOUT",&ECOUT );
readerTMVA->AddVariable( "m2PCAL",&m2PCAL);
readerTMVA->AddVariable( "m2ECIN",&m2ECIN);
readerTMVA->AddVariable( "m2ECOUT",&m2ECOUT);

m_log->Debug("Add variables to readerTMVA");

readerTMVA->BookMVA( "BDT", o_weightfile );

m_log->Debug("TMVA method booked");

lepton.score=readerTMVA->EvaluateMVA("BDT");
```
