

POETIC XI

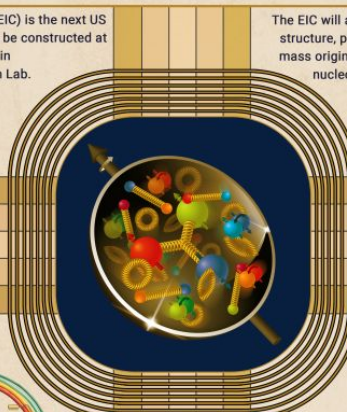

PHYSICS OPPORTUNITIES AT AN ELECTRON-ION COLLIDER

The electron-ion collider (EIC) is the next US nuclear physics facility, to be constructed at Brookhaven National Lab, in partnership with Jefferson Lab. The EIC will push the boundaries of quantum chromodynamics, accelerator science and particle detection.

The EIC will address 3D imaging of proton structure, proton spin dynamics, nucleon mass origin, gluon saturation, in-medium nucleon modifications, quark-gluon confinement mysteries, and casting fresh light on the mystery of why quarks or gluons can never be observed in isolation.
