# ATOF RECONSTRUCTION

NOÉMIE PILLEUX

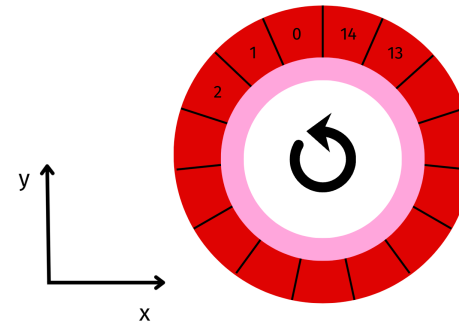

U.S. DEPARTMENT OF  
**ENERGY**

Argonne National Laboratory is a  
U.S. Department of Energy laboratory  
managed by UChicago Argonne, LLC.

Argonne   
NATIONAL LABORATORY

# THE ALERT TOF

- Identifying light ions: H,  $^2\text{H}$ ,  $^3\text{H}$ ,  $^3\text{He}$ ,  $^4\text{He}$  at low momenta.
- Scintillation detector with SiPM readout.
- Surrounds the AHDC, nested in the CD, radius between  $\sim 8$  cm and  $\sim 10$  cm, 30 cm long.
- Composed by 60 modules, each composed by a long **bar** readout at both ends and ten **wedges** readout individually.

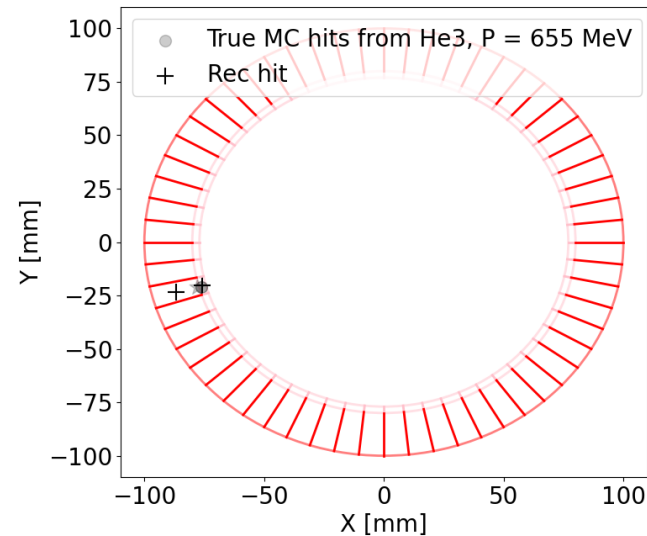

Drawing by T. O'Connor

- Modules are grouped in 15 sectors, each composed by 4 modules readout by the same frontend board.
- Readout based on PETIROC board, recording TDC and TOT information for charge measurement.
- Reconstruction algorithm?
  - Clustering of the TDC/TOT hits.
  - Timing and energy measurement.
  - PID with tracking information.

# ATOF HITS

- ATOF hits are recorded in the ATOF::tdc bank for each channel, saving their **TDC** and **TOT** information.
- Hits in the bar are formed by associating responses from up/down stream ends of the ATOF.
- The geometry service makes the sector/layer/component to x/y/z translation.
  - All x/y and the z position for the wedges are taken as coordinates of the center of each scintillator.
  - The time difference for bar hits gives the z position.
- TOT/TDC to energy/time correcting for light propagation and time offsets.

# ATOF CLUSTERS

- Reading ATOF hits, associating them in clusters.
- Simulations show energy deposit within  $\pm 1$  module of max energy hit and
  - Within  $\pm 1$  “z slices” for the wedges.
  - Some z limit to be defined for the bars.
  - A timing window to be defined.
- Starting from the most energetic hit, clusters are built within these limits, summing their energies and taking the time/position from the most energetic hit.

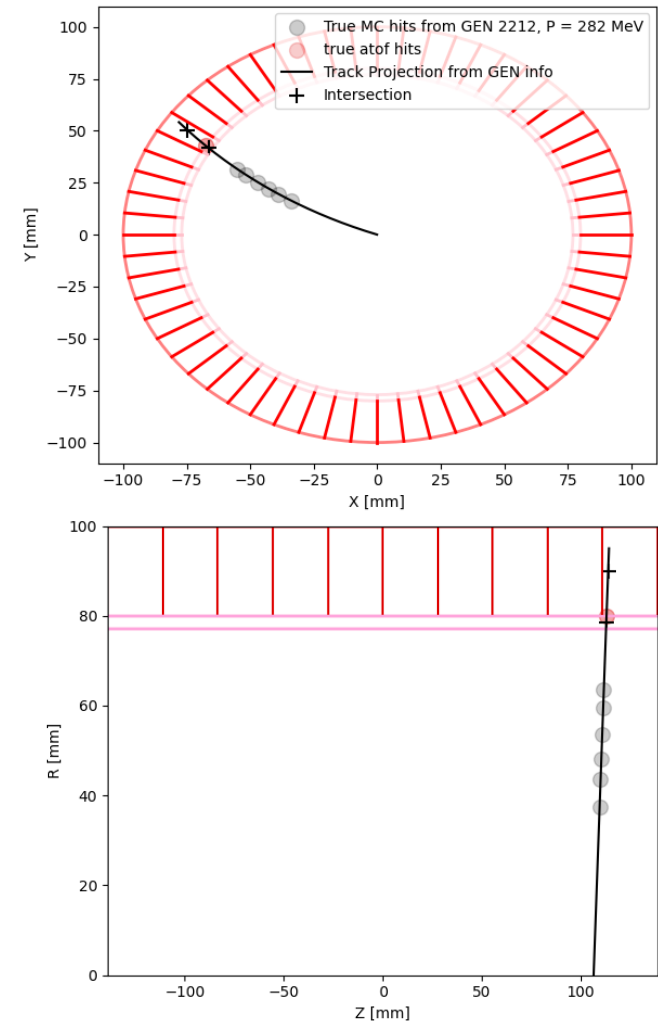

Simulated alpha cluster shape

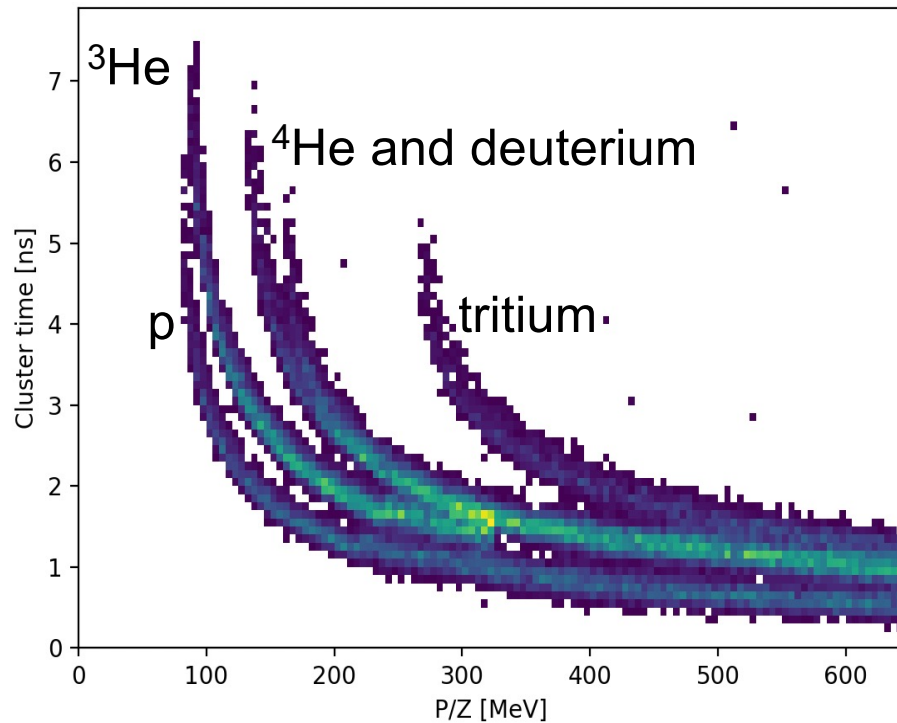

# AHDC-ATOF MATCHING

## AHDC Track Projection

- AHDC tracks and ATOF clusters should be matched for calibrations and PID.
- AHDC tracks are projected onto surfaces of the ATOF using a helix model.
- ALERT::Projections bank created.
  - x,y,z positions at different radii.
  - Path length to surfaces.
  - Path length inside the scintillators.
- Geometrical match between clusters and track projections,  $\phi$ ,z limits to be defined.
- For now, **projecting perfect tracks** using the MC::Particle bank info.

# PID FROM SIMULATIONS

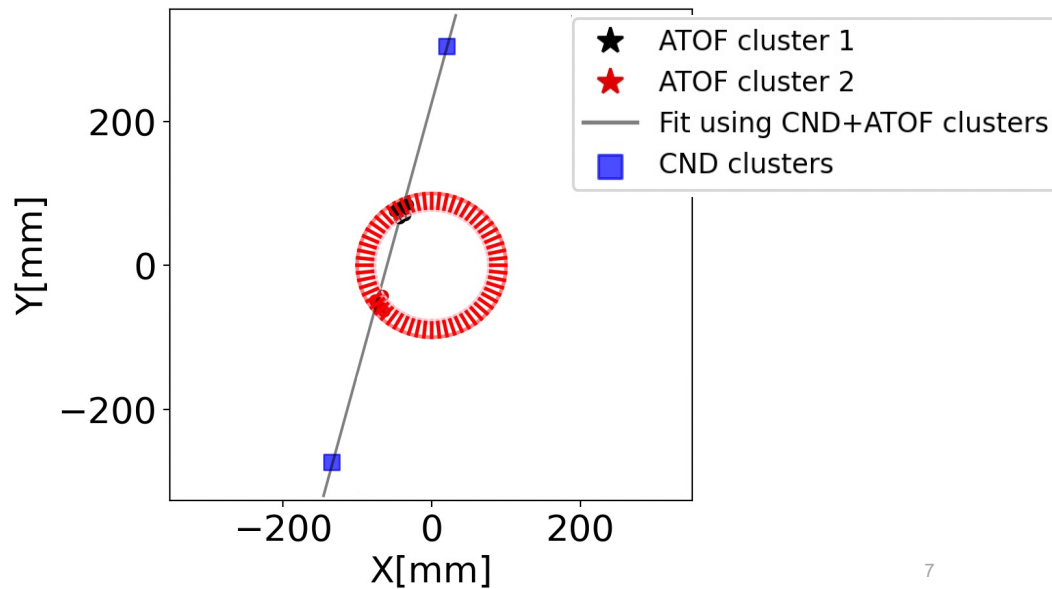

$^4\text{He}$  and D will be further identified using  $dE/dx$ .

Only reflect the geometry resolution, using “perfect tracking” and perfect knowledge of the calibration constants/corrections.

# COSMIC EVENTS TESTS

- ALERT has been taking cosmic runs for a couple of weeks.
- These runs are used to configure the AHDC and the ATOF, test the monitoring software, etc.
- First tests for the ATOF with the clustering algorithm.
- Ongoing efforts to configure the ATOF, study AHDC tracks, first calibrations, etc.
