

# MPGD-Based Transition Radiation Detector for Tracking and Electron ID

Lauren Kasper  
Vanderbilt University

5<sup>th</sup> Annual EICUG Early Career Workshop - July 12<sup>th</sup>, 2025

# Electron Identification at the EIC

---

The EIC aims to unlock key questions in QCD and nuclear structure. Precision measurements demand clean data and robust particle identification (PID)

# Electron Identification at the EIC

The EIC aims to unlock key questions in QCD and nuclear structure. Precision measurements demand clean data and robust particle identification (PID)

- EIC physics will require precise PID of  $>3\sigma$  separation of  $e$ 's from charged hadrons across all rapidity regions
- Precision is particularly challenging in the hadron-going direction - high rate of particles boosted in the lab frame means rigorous  $e$  ID up to at least 15 GeV/c

**Table 3.1:** This matrix summarizes the high level performance of the different subdetectors and a 3 T Solenoid. The interactive version of this matrix can be obtained through the Yellow Report Detector Working Group (<https://physdiv.jlab.org/DetectorMatrix/>).

# Who Cares About $e/\pi$ Separation?

Electrons are key in probing the nucleon and nuclear structure via exclusive channels (e.g.  $J/\Psi$ )

Pion mis-ID is a major background - especially in inclusive & diffractive final states

Precise  $e$  ID ensures cleaner signal in  $e^+e^-$  decays. Essential for reducing combinatorial background in charmonium studies, cross sections, etc.

Clean electron tagging = cleaner physics

# Transition Radiation: $e$ ID + Charged Tracking

Charged particles in wire chambers leave ionization trails  $\rightarrow$  spatial info

TR ( $\sim 2\text{--}40$  keV) produced by charged particles crossing boundary between media of different refractive indices

Total TR energy emitted  $\propto \gamma$ -factor of charged particle; detect both X-rays &  $dE/dx$  losses with heavy gas behind TR radiator

Ideal discrimination of  $e$ 's &  $\pi$ 's at  $2\text{ GeV}/c < p < 100\text{ GeV}/c$

# Micro-Pattern Gaseous Detectors (MPGDs)

Proven use of TRDs in ALICE, COMPASS, ATLAS, but historic limitations - typical wire-chamber signal amplification

Micro-Pattern Gaseous Detectors (MPGDs) are modern gas detectors with micron-scale structures (Ex: GEMs,  $\mu$ MEGAs,  $\mu$ RWELs)

- Provide high granularity spatial resolution & fast signal response
- Leads to reliable use in high-rate ( $>10^6$  Hz/mm<sup>2</sup>) environments, with improved radiation hardness
- Scalable, flexibility in design, compatible with large detector systems

# MPGD-Based TRDs

---

## Benefits Offered:

- Enhanced PID in regions where RICH/TOF coverage is limited
- Opportunity for systematic studies of uncertainties for other  $e$  ID methods, such as calorimetry
- Low-mass  $e$  ID method with low radiation length ( $\sim$ few %)
- Additional charged tracking point gained from nature of gaseous detector

## Trade Offs:

- Heavy gas consumption (\$\$\$)
- Fast readout electronics (flashADC125) necessary for separating TR from  $dE/dx$  (\$\$\$)
- Probability to emit 1 photon per crossing:  $\alpha \sim 1/137$ . Many layers of radiator material = larger space occupancy than typical for a gaseous tracker

# R&D For The EIC

JLab efforts: TRD with triple-GEM amplification. Proof of concept with MPGD integration already demonstrated in test beams and smaller-scale experiments

Additional work done to explore other MPGDs as potential options for a TRD ( $\mu$ RWELL,  $\mu$ MEGAs), 2022 EIC Generic R&D project funded to explore this concept

## A proposal for MPGD-based transition radiation detector/tracker

### Project ID:

**Project Name** MPGD-based transition radiation detector and tracker

**Period:** from 10/1/2022 to 09/30/2023

**Contact Persons:** Yulia Furletova (yulia@jlab.org) and Julia Velkovska (julia.velkovska@vanderbilt.edu)

### Abstract

Transition radiation detectors are widely used for electron identification in various particle physics experiments. For a high luminosity electron-ion collider a high granularity tracker combined with a transition radiation option for particle identification could provide additional electron identification/hadron suppression. Due to the low material budget and cost of MPGD detector technologies, an MPGD based transition radiation detector/tracker (MPGD-TRD/T) is an ideal candidate for a large area hadron endcap where a high flux of hadrons is expected at the EIC.

**Scientific Rating: A**

Approved for 200 PAC days in Hall D

The PAC considers the program to understand the  $J/\psi$  production mechanism critical for the community that aims to use  $J/\psi$  for studying nuclear structure.

**PR12-24-006**

**Scientific Rating:** A

**Recommendation:** Approved for 200 PAC days in Hall D

**Title:** GlueX-III: a path to the Luminosity Frontier in Hall D

**Spokespersons:** M. R. Shepherd

**Motivation:** This proposal seeks to continue data-taking using the GlueX spectrometer in Hall D, taking advantage of higher beam current and possibly higher beam energy (up to 12 GeV) to collect an important sample of charmonium photoproduction events. The relatively large-statistics data, including photon polarization, that will be collected by this experiment will allow examination of the photoproduction mechanism for  $J/\psi$ , which is currently not established. In addition, GlueX will continue to use data collected with a relatively open trigger to examine the light hadron spectrum, collecting sufficient statistics to be able to carry out partial-wave analysis on some currently statistics-limited light meson final states.

**Measurement and Feasibility:** There are no technical concerns that the GlueX collaboration will continue their successful data taking. The addition of a TRD will provide additional important capabilities in the electron-pion separation, which suppresses combinatorial backgrounds and make the data samples cleaner for a partial wave analysis.

The PAC considers the program to understand the  $J/\psi$  production mechanism critical for the community that aims to use  $J/\psi$  for studying nuclear structure.

**Issues:** The experiment should not be run for a significant fraction of the 200 PAC days without the TRD being fully operational. This is because this new subsystem will enhance the quality of the data significantly and might enhance the use of the collected GlueX-III dataset for future analyses not yet planned. Therefore, both JLab and the collaboration should give high priority on finalizing the TRD before GlueX-III data taking starts. The PAC also encourages the GlueX collaboration to give priority to those GlueX-II data analyses that can inform the GlueX-III running.

**Summary:** The PAC agrees that the experiment is very well motivated, and the experimental realization is sound. The addition of the TRD will provide important additional performance enhancement of the GlueX detector and significantly improve the signal to background ratio in general. The PAC therefore recommends approval of the requested 200 PAC days.

X Corr. Between Track Extrap and TRD Point\_Hits

Y Corr. Between Track Extrap and TRD Point\_Hits

# Summary

---

- TRDs can offer clean separation of overlapping topologies and increase precision & efficiency of tracking for neighboring detectors
- Integration of a modern micron-scale amplification structure with a TRD stands to improve position res. & particle flux capability in TRDs as a whole
- A MPGD-based TRD is a compelling potential addition to the EIC toolkit, and stands to improve  $J/\Psi$  and electron-ID heavy analyses
- Time for R&D is now !

# FNAL Test Beam: MMG-TRD

- Current conclusion: inefficient gain in MMG TRD
- Single amplification layer may not be enough on its own

[e11d5d0](#)

# Recap

- Triple-GEM TRD approved for GlueX-III. Grants additional  $e$  ID and charged-track measurement
- Currently have a prototype  $\frac{1}{4}$  of the full detector size, full GlueX-III TRD is in design phase
- Tests in GlueX beamline during ECAL/FCAL commissioning

# Plan & Goals of Recent April Tests

- Test Performance in real GlueX environment (stability, noise, gain, electronics, DAQ rates/data volumes, etc.)
- Collect data for developing TRD integration in GlueX software
- Collect  $e$ ,  $\pi$  samples to evaluate detector performance w.r.t pion suppression (TR signals from charged track dE/dx deposits)
- Estimate effect of this additional material ( $\sim 4\%$ ) for GlueX physics
- Initially use Ar/CO<sub>2</sub> for troubleshooting / reference measurement, then switch to Kr/CO<sub>2</sub>
- Test prototype of gas regulation system
- Build, install, and test large TR radiator

# Gas Regulation System

- Portion of the full system to be developed, first time connecting system to a detector
- Multiple benefits realized
  - Conservation of heavy gas
  - Allow fine control of internal pressure (ind. of flow)
  - Reduce window bulging → more uniform E\_Field
  - Reduced drift gap size (less HV needed for adequate drift field)
  - Gas analyzer connection on detector output (gas quality monitoring)

# Essential Processes at the EIC Involving $e$ ID (Physics Motivation)

- $J/\Psi$  Production (DIS): Requires reconstruction of *all* particles involved. Transverse spatial distribution of gluons can be obtained from the exclusive x-section of  $J/\psi \rightarrow e^+e^-$ . Improved  $e$  ID could increase  $J/\psi$  detection efficiency
- Open Heavy Flavor Production: branching ratio of D-mesons is  $\text{Br}(D^+ \rightarrow e^+ + X) \sim 16\%$  and of B-mesons is  $\text{Br}(B^\pm \rightarrow e^\pm + \nu + Xc) \sim 10\%$ . Due to the large decay length of heavy-flavor hadrons, these mesons will have significant decay vertex displacement
- Exotic Hadrons (XYZ States): In the process  $Z^+c \rightarrow J/\psi + \pi^+ \rightarrow e^+ + e^- + \pi^+$  the emergent  $e$ 's are forward boosted, so their detection is difficult due to several orders of magnitude higher hadronic background. The nature of such exotic states remains unclear, and further investigations are needed

X mean offset:  $\sim -2\text{mm}$  ( $-2.27\text{mm}$ )

Y mean offset:  $\sim 1\text{mm}$  ( $1.07\text{mm}$ )

# Cyclic Behavior

# Future Plans

The GlueX-III proposal was based on 1/4 detector;  
PAC recommended building the full detector to be  
used during most of the GlueX-III running

Helps with reducing systematics for J/Psi production

- Started working on contract with UVA (2.5y, \$264k):
- design the detector
- long-term procurement - GEM foils, readout board from CERN, GEM frames (~1 year)
- Design and fabricate the tolling: foil stretcher, assembly jigs, HV test box etc.
- Prepare clean room and parts, stretch and glue GEM foils
- Assemble detector
- Preliminary tests with cosmics and x-rays

# TRD Gas Mixtures

- Operational gas mixture changed from Ar-based mixture to Xe-based → Heavy gases required for efficient X-ray absorption
- Compare various noble gases in terms of absorption power for 20 mm gas thickness. Best gas is Xe
- Xe-based mixture requires higher fields ( $\sim 2000$  V/cm) for a similar drift velocity as Ar ( $\sim 1000$  V/cm). High cost of Xe means closed loop gas system necessary
