- Pi0 calibration (of data)
- High statistics simulation for all settings
- Simulation energy (calibration) and smearing
- Cuts optimization (HMS, Calorimeter, target)
- Corrections:
 - Accidentals (for p0 accidental subtraction is more involved)
 - Multiple clusters in calorimeter
 - Efficiencies (HMS tracking, VTP trigger, etc)
 - Target density
- Pi0 subtraction (simulations needed for settings)
- Cross-section extraction (minimization to fit CFF combinations)
- Systematics estimates:
 - Missing mass cut
 - Deadtime, efficiencies, luminosity, etc

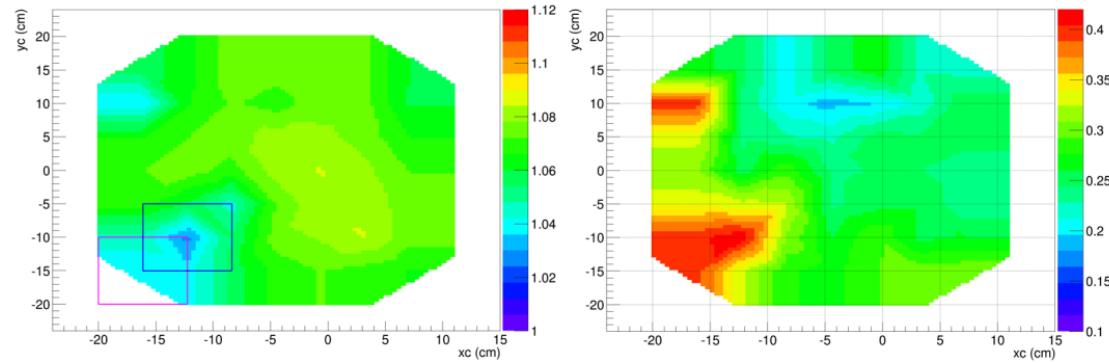

Figure 5.5: Left (Right): value of the interpolated parameter μ (σ) with respect to the impact position of the photon in the calorimeter for kin48_2. The parameter σ is expressed in GeV. The magenta and blue rectangles represent the boundaries of 2 out of the 49 rectangular regions where the coefficients μ_j and σ_j are computed.
