Target list

Material	Thickness (mg/cm²)	Density (mg/cm³)	Beam current (µA)
^{6}Li	100	0.534	50
^{9}Be	100	1.848	50
^{11}B	100	2.340	50
^{27}Al	150	2.70	50
^{40}Ca	150	1.55	50
^{48}Ca	150	1.55	50
^{208}Pb	150	11.342	25
^{12}C	150	1.750	50
^{12}C hall	150	1.750	50
LiH	450/150/100	0.820	50
H_2O	-	1.00	-
CH_2	450	0.930	2

Experiment target

Calibration target

K. Ishido (Kyoto Univ.), JLab Hypernuclear Collaboration Meeting 2026, Feb 13, 2026, Jefferson Lab, Newport News, US

京都大学　理学研究科・理学部
GRADUATE SCHOOL OF FACULTY OF SCIENCE
KYOTO UNIVERSITY

2 /10

Purpose and calculation flow

Geant4
Energy-deposit simulation

Inventor
3D CAD design

The maximum temperature is evaluated

ANSYS
Thermal simulation

Check / refine the design
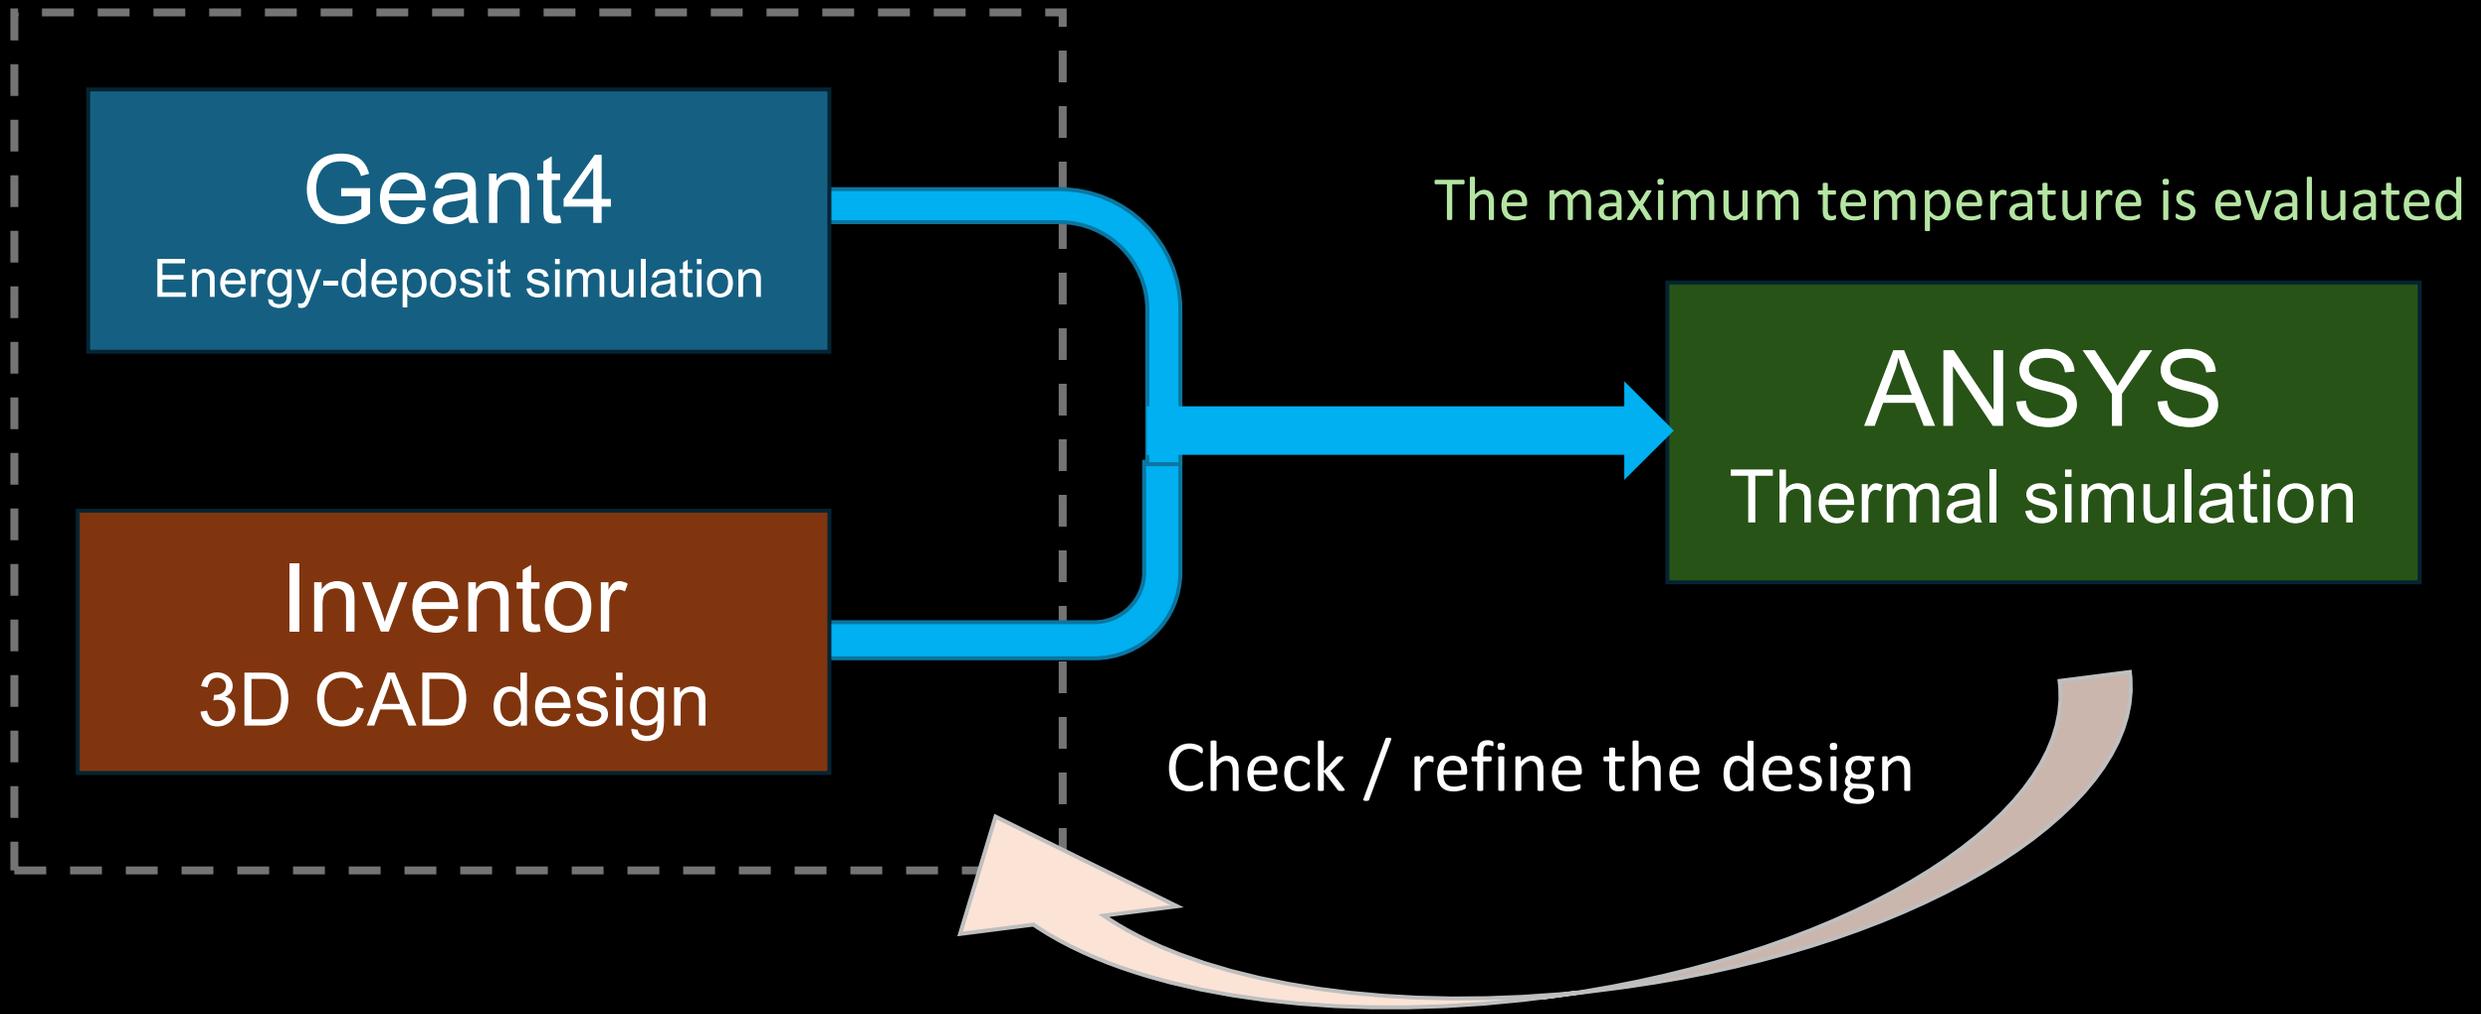

Energy deposit simulation by Geant4

Simulation set up

target material

2.24GeV
electron beam

- Simply a cube
- Set in a vacuum

energy deposit

Count

Mean value
0.86

2μA
CH_2: 450mg/cm^2

energy [MeV]

LiH : Thermal simulation result

Melting point ~950K

In a simple model, LiH does not melt, either with or without raster

w/o Raster

with Raster

Summary & outlook

Thermal simulation of the targets

- Three tools
  - Geant4 (Energy deposit)
  - 3D-CAD software (design)
  - ANSYS (temperature)
- I have successfully gone through entire simulation flow

Outlook

- More realistic design will be incorporated in the simulation, cooperating with the target (David Meekins+) and designer teams
- Monte Carlo simulations for evaluating the effect on missing mass measurement from target design (thickness uncertainty / uniformity etc.) (in progress)
